

mRNA encoded by LOC169611, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169611 BINDING SITE, designated SEQ ID:40285, to the nucleotide sequence of VGAM340 RNA, herein designated VGAM RNA, also designated SEQ ID:3051.

[17712] Another function of VGAM340 is therefore inhibition of LOC169611 (Accession XM\_095809). Accordingly, utilities of VGAM340 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC169611. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 341 (VGAM341) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17713] VGAM341 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM341 was detected is described hereinabove with reference to Figs. 1–8.

[17714] VGAM341 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Tobacco Mosaic Virus. VGAM341 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17715] VGAM341 gene encodes a VGAM341 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM341 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM341 precursor RNA is designated SEQ ID:327, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:327 is located at position 2648 relative to the genome of Tobacco Mosaic Virus.

[17716] VGAM341 precursor RNA folds onto itself, forming VGAM341 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17717] An enzyme complex designated DICER COMPLEX, `dices` the VGAM341 folded precursor RNA into VGAM341 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM341 RNA is designated SEQ ID:3052, and is provided hereinbelow with reference to the sequence listing part.

[17718] VGAM341 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM341 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM341 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[17719] VGAM341 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM341 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM341 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM341 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM341 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[17720] The complementary binding of VGAM341 RNA, herein designated VGAM RNA, to host target binding sites on VGAM341 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM341 host tar-

get RNA into VGAM341 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17721] It is appreciated that VGAM341 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM341 host target genes. The mRNA of each one of this plurality of VGAM341 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM341 RNA, herein designated VGAM RNA, and which when bound by VGAM341 RNA causes inhibition of translation of respective one or more VGAM341 host target proteins.

[17722] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM341 gene, herein designated VGAM GENE, on one or more VGAM341 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[17723] It is yet further appreciated that a function of VGAM341 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM341 include diagnosis, prevention and treatment of viral infection by Tobacco Mosaic Virus. Specific functions, and accordingly utilities, of VGAM341 correlate with, and may be deduced from, the identity of the host target genes which VGAM341 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17724] Nucleotide sequences of the VGAM341 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM341 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM341 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM341 are further

described hereinbelow with reference to Table 1.

[17725] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM341 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM341 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17726] As mentioned hereinabove with reference to Fig. 1, a function of VGAM341 gene, herein designated VGAM is inhibition of expression of VGAM341 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM341 correlate with, and may be deduced from, the identity of the target genes which VGAM341 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17727] GRB2-associated Binding Protein 2 (GAB2, Accession NM\_012296) is a VGAM341 host target gene. GAB2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GAB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAB2

BINDING SITE, designated SEQ ID:14649, to the nucleotide sequence of VGAM341 RNA, herein designated VGAM RNA, also designated SEQ ID:3052.

[17728] A function of VGAM341 is therefore inhibition of GRB2-associated Binding Protein 2 (GAB2, Accession NM\_012296), a gene which act as adapters for transmitting various signals. Accordingly, utilities of VGAM341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAB2. The function of GAB2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM53. Growth Hormone Receptor (GHR, Accession NM\_000163) is another VGAM341 host target gene. GHR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GHR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GHR BINDING SITE, designated SEQ ID:5674, to the nucleotide sequence of VGAM341 RNA, herein designated VGAM RNA, also designated SEQ ID:3052.

[17729] Another function of VGAM341 is therefore inhibition of

Growth Hormone Receptor (GHR, Accession NM\_000163). Accordingly, utilities of VGAM341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GHR. Gap Junction Protein, Alpha 1, 43kDa (connexin 43) (GJA1, Accession NM\_000165) is another VGAM341 host target gene. GJA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GJA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GJA1 BINDING SITE, designated SEQ ID:5681, to the nucleotide sequence of VGAM341 RNA, herein designated VGAM RNA, also designated SEQ ID:3052.

[17730] Another function of VGAM341 is therefore inhibition of Gap Junction Protein, Alpha 1, 43kDa (connexin 43) (GJA1, Accession NM\_000165), a gene which may act in synchronizing heart contraction and embryonic development. Accordingly, utilities of VGAM341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GJA1. The function of GJA1 has been established by previous studies. The migration of lymphocytes from the circulation into tissues involves a number of ad-

hesion molecules and the expression of new molecules. Gap junctions facilitate cell-to-cell adhesion and provide pathways for direct intercellular communication. Oviedo-Orta et al. (2000) noted that GJA1 is expressed in a number of lymphoid organs. By RT-PCR, Western blot, and flow cytometric analyses, they showed that lymphocytes express GJA1 and GJA5 (OMIM Ref. No. 121013), but not GJB2 (OMIM Ref. No. 121011), GJB1 (OMIM Ref. No. 304040), GJA4 (OMIM Ref. No. 121012), or GJA7; GJA5 expression was restricted to tonsillar T and B lymphocytes. Flow cytometric analysis showed that GJA1 and GJA5 expression increases after mitogenic stimulation. Extracellular connexin mimetic peptide blocked dye transfer between lymphocyte subpopulations, and gap junction inhibitors decreased the production of IgM in cocultured T and B lymphocytes. The results identified gap junction proteins as important cell surface components that modulate immune responses. Animal model experiments lend further support to the function of GJA1. By targeted mutagenesis of connexin-43, Reaume et al. (1995) showed that its absence was compatible with survival of mouse embryos to term, even though cell lines mutant in Cx43 showed reduced dye coupling in vitro as assessed by in-

jection of carboxyfluorescein. The latter test indicated a reduction, but not complete absence, of junctional communication. However, mutant embryos died at birth as a result of a failure in pulmonary gas exchange caused by a swelling and blockage of the right ventricular outflow tract from the heart. Reaume et al. (1995) interpreted this finding as indicating that Cx43 plays an essential role in heart development but that there is functional compensation among connexins in other parts of the developing fetus.

[17731] It is appreciated that the abovementioned animal model for GJA1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[17732] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17733] Oviedo-Orta, E.; Hoy, T.; Evans, W. H. : Intercellular communication in the immune system: differential expression of connexin40 and 43, and perturbation of gap junction channel functions in peripheral blood and tonsil human lymphocyte subpopulations. Immunology 99: 578-590, 2000. ; and

[17734] Reaume, A. G.; de Sousa, P. A.; Kulkarni, S.; Langille, B. L.;

Zhu, D.; Davies, T. C.; Juneja, S. C.; Kidder, G. M.; Rossant, J. : Cardiac malformation in neonatal mice lacking connex.

[17735] Further studies establishing the function and utilities of GJA1 are found in John Hopkins OMIM database record ID 121014, and in cited publications numbered 11845–11850, 11978, 136–139, 12142–142, 11843–145, 145–14 and 11839 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Host Cell Factor C1 (VP16–accessory protein) (HCFC1, Accession XM\_048390) is another VGAM341 host target gene. HCFC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HCFC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCFC1 BINDING SITE, designated SEQ ID:35156, to the nucleotide sequence of VGAM341 RNA, herein designated VGAM RNA, also designated SEQ ID:3052.

[17736] Another function of VGAM341 is therefore inhibition of Host Cell Factor C1 (VP16–accessory protein) (HCFC1, Accession XM\_048390), a gene which is a host cell factor, has a role in cell proliferation and can form a complex

with HSV VP16. Accordingly, utilities of VGAM341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCFC1. The function of HCFC1 has been established by previous studies. By fluorescence in situ hybridization and somatic cell hybrid analysis, Wilson et al. (1995) mapped the HCFC1 gene to Xq28. YAC and cosmid mapping localized the HCFC1 gene within 100 kb distal of the V2R gene (OMIM Ref. No. 304800) and adjacent to the renin-binding protein gene (OMIM Ref. No. 312420). HCF transcripts and protein are most abundant in fetal and placental tissues and cell lines, suggesting a role in cell proliferation. In adults, HCF protein is abundant in the kidney, but not in the brain, a site of latent herpes simplex virus (HSV) infection and a site where HCF levels may influence progression of HSV infection. Zoppe et al. (1996) reported the complete sequence of the HCFC1 gene, including 2 kb of the 5-prime-flanking region and 5.9 kb of the first intron. In addition to the detection of many putative binding sites for known DNA binding proteins, a highly conserved 17-bp sequence was found to be present 6 times at regular intervals in the 5-prime region of the gene. This motif is capable of binding the transcription factor Yin/Yang 1

(YY1) as well as another unidentified factor, suggesting that HCFC1 expression is regulated by the interaction of these factors.

[17737] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17738] Wilson, A. C.; Parrish, J. E.; Massa, H. F.; Nelson, D. L.; Trask, B. J.; Herr, W. : The gene encoding the VP16-accessory protein HCF (HCFC1) resides in human Xq28 and is highly expressed in fetal tissues and the adult kidney. Genomics 25: 462-468, 1995. ; and

[17739] Zoppe, M.; Frattini, A.; Faranda, S.; Vezzoni, P. : The complete sequence of the host cell factor 1 (HCFC1) gene and its promoter: a role for YY1 transcription factor in the regulation o.

[17740] Further studies establishing the function and utilities of HCFC1 are found in John Hopkins OMIM database record ID 300019, and in cited publications numbered 7265-7270 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Neurotrophic Tyrosine Kinase, Receptor, Type 2 (NTRK2, Accession NM\_006180) is another VGAM341 host target gene. NTRK2 BINDING SITE is HOST TARGET binding

site found in the 3' untranslated region of mRNA encoded by NTRK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NTRK2 BINDING SITE, designated SEQ ID:12850, to the nucleotide sequence of VGAM341 RNA, herein designated VGAM RNA, also designated SEQ ID:3052.

[17741] Another function of VGAM341 is therefore inhibition of Neurotrophic Tyrosine Kinase, Receptor, Type 2 (NTRK2, Accession NM\_006180), a gene which is involved in the development and/or maintenance of the nervous system. Accordingly, utilities of VGAM341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NTRK2. The function of NTRK2 has been established by previous studies. Nakagawara et al. (1995) isolated cDNAs spanning the entire coding region of both human full-length and truncated forms of TRKB from human brain cDNA libraries. The full-length TRKB coded for a protein of 822 amino acid residues. The putative mature peptide sequence was 49% and 55% homologous to human NTRK1 and NTRK3, respectively. Nine of 13 cysteine residues, 4 of 12 N-glycosylation sites in the extracellular

domain, and 10 of 13 tyrosine residues in the intracellular domain are conserved among NTRK1, NTRK2, and NTRK3. Two major sizes of NTRK2 transcripts were expressed in human brain. Animal model experiments lend further support to the function of NTRK2. To study the function of TRKB in the cerebellum, Rico et al. (2002) deleted the *Trkb* gene in mouse cerebellar precursors by Wnt1-driven Cre-mediated recombination. Despite the absence of *Trkb*, the mature cerebellum of mutant mice appeared similar to that of wildtype, with all types of cells present in normal numbers and positions. Granule and Purkinje cell dendrites appeared normal, and the former had typical numbers of excitatory synapses. By contrast, inhibitory interneurons were strongly affected. Although present in normal number, inhibitory interneurons exhibited reduced amounts of GABAergic markers and developed reduced numbers of GABAergic boutons and synaptic specializations. Thus, Rico et al. (2002) concluded that TRKB is essential to the development of GABAergic neurons and regulates synapse formation in addition to its role in the development of axon terminals.

[17742] It is appreciated that the abovementioned animal model for NTRK2 is acknowledged by those skilled in the art as a

scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[17743] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17744] Nakagawara, A.; Liu, X.-G.; Ikegaki, N.; White, P. S.; Yamashiro, D. J.; Nycum, L. M.; Biegel, J. A.; Brodeur, G. M. : Cloning and chromosomal localization of the human TRK-B tyrosine kinase receptor gene (NTRK2). *Genomics* 25: 538–546, 1995. ; and

[17745] Rico, B.; Xu, B.; Reichardt, L. F. : TrkB receptor signaling is required for establishment of GABAergic synapses in the cerebellum. *Nature Neurosci.* 5: 225–233, 2002.

[17746] Further studies establishing the function and utilities of NTRK2 are found in John Hopkins OMIM database record ID 600456, and in cited publications numbered 1939–1940, 1942, 12375–161 and 12342 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Proteasome (prosome, macropain) 26S Subunit, Non-ATPase, 5 (PSMD5, Accession NM\_005047) is another VGAM341 host target gene. PSMD5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

PSMD5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSMD5 BINDING SITE, designated SEQ ID:11480, to the nucleotide sequence of VGAM341 RNA, herein designated VGAM RNA, also designated SEQ ID:3052.

[17747] Another function of VGAM341 is therefore inhibition of Proteasome (prosome, macropain) 26S Subunit, Non-ATPase, 5 (PSMD5, Accession NM\_005047), a gene which is the non-ATPase subunit 5 of the 26S proteasome (prosome macropain). Accordingly, utilities of VGAM341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSMD5. The function of PSMD5 has been established by previous studies. The covalent attachment of ubiquitin to proteins produces substrates for the 26S ATP-dependent protease. This enzyme is composed of the multicatalytic protease, or proteasome, and a regulatory ATPase complex. Both the multicatalytic protease and the regulatory complex are multi-subunit structures that associate in the presence of ATP to form the 26S enzyme. Deveraux et al. (1994) identified a 50-kD subunit of the regulatory complex, which they

called subunit 5 (S5) based upon its relative mobility on SDS–polyacrylamide gels. Deveraux et al. (1995) demonstrated that 2 distinct subunits of the 26S protease migrate as 50–kD proteins, and thus, S5 represents 2 proteins, which the authors termed S5A (PSMD4; 601648) and S5B, also called PSMD5. Deveraux et al. (1995) sequenced peptides from the PSMD5 subunit of the human red blood cell 26S protease. Using the amino acid sequence, they isolated human cDNAs comprising a full–length PSMD5 cDNA. The deduced 505–amino acid PSMD5 protein is enriched in leucine residues, particularly in the N–terminal region. PSMD5 contains 9 dileucine repeats and a sequence, NPNY, similar to the tyrosine–based motifs. Dileucine repeats and tyrosine–based motifs are thought to contribute to internalization and/or targeting. PSMD5 has a calculated molecular mass of 56 kD and focuses at pH 5.3 on 2–dimensional gels. Recombinant PSMD5 did not bind to ubiquitin polymers. By sequencing cDNAs randomly selected from a cDNA library derived from a human immature myeloid cell line, Nomura et al. (1994) isolated a partial cDNA encoding PSMD5, which they called KIAA0072. Northern blot analysis detected PSMD5 expression in a wide variety of human tissues, with the highest

expression in lung and skeletal muscle. Deveraux et al. (1995) noted that the nucleotide sequence of the KIAA0072 cDNA is identical to the corresponding nucleotide sequence of the S5B cDNA.

[17748] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17749] Deveraux, Q.; Jensen, C.; Rechsteiner, M. : Molecular cloning and expression of a 26 S protease subunit enriched in dileucine repeats. J. Biol. Chem. 270: 23726–23729, 1995. ; and

[17750] Deveraux, Q.; Ustrell, V.; Pickart, C.; Rechsteiner, M. : A 26 S protease subunit that binds ubiquitin conjugates. J. Biol. Chem. 269: 7059–7061, 1994.

[17751] Further studies establishing the function and utilities of PSMD5 are found in John Hopkins OMIM database record ID 604452, and in cited publications numbered 6555–655 and 2255 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Retinal Degeneration, Slow (retinitis pigmentosa 7) (RDS, Accession NM\_000322) is another VGAM341 host target gene. RDS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RDS, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RDS BINDING SITE, designated SEQ ID:5864, to the nucleotide sequence of VGAM341 RNA, herein designated VGAM RNA, also designated SEQ ID:3052.

[17752] Another function of VGAM341 is therefore inhibition of Retinal Degeneration, Slow (retinitis pigmentosa 7) (RDS, Accession NM\_000322), a gene which may function as an adhesion molecule involved in stabilization and compaction of outer segment disks or in the maintenance of the curvature of the rim. Accordingly, utilities of VGAM341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RDS. The function of RDS has been established by previous studies. In mammals, most cyanide is converted to thiocyanate by the mitochondrial enzyme thiosulfate sulfurtransferase. Cagianut et al. (1981) found much reduced activity of this enzyme in the livers of 2 males with Leber optic atrophy (OMIM Ref. No. 535000) from a well-studied Swiss family with 5 symptomatic persons in 4 generations. Nikoskelainen (1984) could not confirm the reported low activity of rhodanese in Leber patients. Whitehouse et al. (1989)

studied rhodanese isozymes in liver biopsies from 3 subjects with Leber optic neuropathy. No qualitative abnormality and no deficiency could be found, thus excluding the hypothesis of rhodanese deficiency. By screening a human fetal liver cDNA expression library with a monoclonal antibody against bovine liver rhodanese, Aita et al. (1997) cloned a RDS cDNA. Northern blotting showed that the RDS gene is expressed as a 1.3-kb mRNA. It encodes a predicted 297-amino acid protein that is approximately 90% identical to rodent and bovine Rds. Transient expression of the RDS cDNA in *E. coli* and in mammalian cells resulted in significantly increased rhodanese activity. Animal model experiments lend further support to the function of RDS.

[17753] It is appreciated that the abovementioned animal model for RDS is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[17754] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17755] Whitehouse, D. B.; Poole, C. J. M.; Kind, P. R. N.; Hopkinson, D. A. : Rhodanese isozymes in three subjects with

Leber's optic neuropathy. J. Med. Genet. 26: 113–115, 1989. ; and

[17756] Aita, N.; Ishii, K.; Akamatsu, Y.; Ogasawara, Y.; Tanabe, S. : Cloning and expression of human liver rhodanese cDNA. Biochem. Biophys. Res. Commun. 231: 56–60, 1997.

[17757] Further studies establishing the function and utilities of RDS are found in John Hopkins OMIM database record ID 180370, and in cited publications numbered 2552–255 and 11874–2558 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Transmembrane, Prostate Androgen Induced RNA (TMEPAI, Accession NM\_020182) is another VGAM341 host target gene. TMEPAI BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TMEPAI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TMEPAI BINDING SITE, designated SEQ ID:21408, to the nucleotide sequence of VGAM341 RNA, herein designated VGAM RNA, also designated SEQ ID:3052.

[17758] Another function of VGAM341 is therefore inhibition of Transmembrane, Prostate Androgen Induced RNA

(TMEPAI, Accession NM\_020182). Accordingly, utilities of VGAM341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMEPAI. Tripartite Motif-containing 9 (TRIM9, Accession NM\_015163) is another VGAM341 host target gene. TRIM9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM9 BINDING SITE, designated SEQ ID:17513, to the nucleotide sequence of VGAM341 RNA, herein designated VGAM RNA, also designated SEQ ID:3052.

[17759] Another function of VGAM341 is therefore inhibition of Tripartite Motif-containing 9 (TRIM9, Accession NM\_015163), a gene which may function as a positive regulator for mannosylphosphate transferase and is required to mediate mannosylphosphate transfer in both the core and outer chain portions of n-linked oligosaccharides. Accordingly, utilities of VGAM341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM9. The function of TRIM9 and its association with various diseases and clinical condi-

tions, has been established by previous studies, as described hereinabove with reference to VGAM74. Blepharophimosis, Epicanthus Inversus and Pto- sis, Candidate 1 (BPESC1, Accession NM\_021812) is another VGAM341 host target gene. BPESC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BPESC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND- ING SITE II or BINDING SITE III. Table 2 illustrates the com- plementarity of the nucleotide sequences of BPESC1 BIND- ING SITE, designated SEQ ID:22375, to the nucleotide se- quence of VGAM341 RNA, herein designated VGAM RNA, also designated SEQ ID:3052.

[17760] Another function of VGAM341 is therefore inhibition of Blepharophimosis, Epicanthus Inversus and Pto- sis, Candi- date 1 (BPESC1, Accession NM\_021812). Accordingly, util- ities of VGAM341 include diagnosis, prevention and treat- ment of diseases and clinical conditions associated with BPESC1. Chromosome 1 Open Reading Frame 22 (C1orf22, Accession NM\_025191) is another VGAM341 host target gene. C1orf22 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C1orf22, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf22 BINDING SITE, designated SEQ ID:24836, to the nucleotide sequence of VGAM341 RNA, herein designated VGAM RNA, also designated SEQ ID:3052.

[17761] Another function of VGAM341 is therefore inhibition of Chromosome 1 Open Reading Frame 22 (C1orf22, Accession NM\_025191). Accordingly, utilities of VGAM341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf22. FLJ14075 (Accession NM\_024894) is another VGAM341 host target gene. FLJ14075 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14075, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14075 BINDING SITE, designated SEQ ID:24375, to the nucleotide sequence of VGAM341 RNA, herein designated VGAM RNA, also designated SEQ ID:3052.

[17762] Another function of VGAM341 is therefore inhibition of FLJ14075 (Accession NM\_024894). Accordingly, utilities of

VGAM341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14075. KIAA0852 (Accession NM\_014941) is another VGAM341 host target gene. KIAA0852 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0852, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0852 BINDING SITE, designated SEQ ID:17249, to the nucleotide sequence of VGAM341 RNA, herein designated VGAM RNA, also designated SEQ ID:3052.

[17763] Another function of VGAM341 is therefore inhibition of KIAA0852 (Accession NM\_014941). Accordingly, utilities of VGAM341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0852. KIAA1203 (Accession XM\_049683) is another VGAM341 host target gene. KIAA1203 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1203, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1203 BINDING SITE, designated SEQ ID:35469, to the nucleotide sequence of VGAM341 RNA, herein designated VGAM RNA, also designated SEQ ID:3052.

[17764] Another function of VGAM341 is therefore inhibition of KIAA1203 (Accession XM\_049683). Accordingly, utilities of VGAM341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1203. Mitogen-activated Protein Kinase Kinase Kinase 2 (MAP3K2, Accession NM\_006609) is another VGAM341 host target gene. MAP3K2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAP3K2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP3K2 BINDING SITE, designated SEQ ID:13387, to the nucleotide sequence of VGAM341 RNA, herein designated VGAM RNA, also designated SEQ ID:3052.

[17765] Another function of VGAM341 is therefore inhibition of Mitogen-activated Protein Kinase Kinase Kinase 2 (MAP3K2, Accession NM\_006609). Accordingly, utilities of VGAM341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K2.

Roundabout Homolog 4, Magic Roundabout (Drosophila) (ROBO4, Accession NM\_019055) is another VGAM341 host target gene. ROBO4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ROBO4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ROBO4 BINDING SITE, designated SEQ ID:21136, to the nucleotide sequence of VGAM341 RNA, herein designated VGAM RNA, also designated SEQ ID:3052.

[17766] Another function of VGAM341 is therefore inhibition of Roundabout Homolog 4, Magic Roundabout (Drosophila) (ROBO4, Accession NM\_019055). Accordingly, utilities of VGAM341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ROBO4. SE70-2 (Accession NM\_022118) is another VGAM341 host target gene. SE70-2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SE70-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SE70-2 BINDING SITE, designated

SEQ ID:22665, to the nucleotide sequence of VGAM341 RNA, herein designated VGAM RNA, also designated SEQ ID:3052.

[17767] Another function of VGAM341 is therefore inhibition of SE70-2 (Accession NM\_022118). Accordingly, utilities of VGAM341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SE70-2. TTY7 (Accession NM\_031926) is another VGAM341 host target gene. TTY7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TTY7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TTY7 BINDING SITE, designated SEQ ID:25674, to the nucleotide sequence of VGAM341 RNA, herein designated VGAM RNA, also designated SEQ ID:3052.

[17768] Another function of VGAM341 is therefore inhibition of TTY7 (Accession NM\_031926). Accordingly, utilities of VGAM341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TTY7. LOC130074 (Accession XM\_072228) is another VGAM341 host target gene. LOC130074 BINDING SITE is HOST TAR-

GET binding site found in the 3' untranslated region of mRNA encoded by LOC130074, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130074 BINDING SITE, designated SEQ ID:37472, to the nucleotide sequence of VGAM341 RNA, herein designated VGAM RNA, also designated SEQ ID:3052.

[17769] Another function of VGAM341 is therefore inhibition of LOC130074 (Accession XM\_072228). Accordingly, utilities of VGAM341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130074. LOC152457 (Accession XM\_087476) is another VGAM341 host target gene. LOC152457 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152457, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152457 BINDING SITE, designated SEQ ID:39278, to the nucleotide sequence of VGAM341 RNA, herein designated VGAM RNA, also designated SEQ ID:3052.

[17770] Another function of VGAM341 is therefore inhibition of

LOC152457 (Accession XM\_087476). Accordingly, utilities of VGAM341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152457. LOC170106 (Accession XM\_093106) is another VGAM341 host target gene. LOC170106 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC170106, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170106 BINDING SITE, designated SEQ ID:40174, to the nucleotide sequence of VGAM341 RNA, herein designated VGAM RNA, also designated SEQ ID:3052.

[17771] Another function of VGAM341 is therefore inhibition of LOC170106 (Accession XM\_093106). Accordingly, utilities of VGAM341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170106. LOC200860 (Accession XM\_117289) is another VGAM341 host target gene. LOC200860 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200860, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC200860 BINDING SITE, designated SEQ ID:43358, to the nucleotide sequence of VGAM341 RNA, herein designated VGAM RNA, also designated SEQ ID:3052.

[17772] Another function of VGAM341 is therefore inhibition of LOC200860 (Accession XM\_117289). Accordingly, utilities of VGAM341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200860. LOC221300 (Accession XM\_166322) is another VGAM341 host target gene. LOC221300 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221300, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221300 BINDING SITE, designated SEQ ID:44149, to the nucleotide sequence of VGAM341 RNA, herein designated VGAM RNA, also designated SEQ ID:3052.

[17773] Another function of VGAM341 is therefore inhibition of LOC221300 (Accession XM\_166322). Accordingly, utilities of VGAM341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221300. LOC90161 (Accession XM\_029551) is an-

other VGAM341 host target gene. LOC90161 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90161, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90161 BINDING SITE, designated SEQ ID:30903, to the nucleotide sequence of VGAM341 RNA, herein designated VGAM RNA, also designated SEQ ID:3052.

[17774] Another function of VGAM341 is therefore inhibition of LOC90161 (Accession XM\_029551). Accordingly, utilities of VGAM341 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90161. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 342 (VGAM342) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17775] VGAM342 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM342 was detected is described

hereinabove with reference to Figs. 1–8.

[17776] VGAM342 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tobacco Mosaic Virus.

VGAM342 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17777] VGAM342 gene encodes a VGAM342 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM342 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM342 precursor RNA is designated SEQ ID:328, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:328 is located at position 3311 relative to the genome of Tobacco Mosaic Virus.

[17778] VGAM342 precursor RNA folds onto itself, forming VGAM342 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17779] An enzyme complex designated DICER COMPLEX, `dices` the VGAM342 folded precursor RNA into VGAM342 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM342 RNA is designated SEQ ID:3053, and is provided hereinbelow with reference to the sequence listing part.

[17780] VGAM342 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM342 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM342 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[17781] VGAM342 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM342 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM342 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM342 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM342 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[17782] The complementary binding of VGAM342 RNA, herein designated VGAM RNA, to host target binding sites on VGAM342 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM342 host target RNA into VGAM342 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17783] It is appreciated that VGAM342 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM342 host target genes. The mRNA of each one of this plurality of VGAM342 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM342 RNA, herein designated VGAM RNA, and which when bound by VGAM342 RNA causes inhibition of translation of respective one or more VGAM342 host target proteins.

[17784] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM342 gene, herein designated VGAM GENE, on one or more VGAM342 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[17785] It is yet further appreciated that a function of VGAM342 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM342 include diagnosis, prevention and treatment of viral infection by Tobacco Mosaic Virus. Specific functions, and accordingly utilities, of VGAM342 correlate with, and may be deduced from, the identity of the host target genes which VGAM342 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17786] Nucleotide sequences of the VGAM342 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM342 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM342 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM342 are further described hereinbelow with reference to Table 1.

[17787] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM342 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM342 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17788] As mentioned hereinabove with reference to Fig. 1, a function of VGAM342 gene, herein designated VGAM is inhibition of expression of VGAM342 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM342 correlate with, and may be deduced from, the identity of the target genes which VGAM342 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17789] Membrane Protein, Palmitoylated 2 (MAGUK p55 subfamily member 2) (MPP2, Accession XM\_008355) is a VGAM342 host target gene. MPP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MPP2, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MPP2 BINDING SITE, designated SEQ ID:30078, to the nucleotide sequence of VGAM342 RNA, herein designated VGAM RNA, also designated SEQ ID:3053.

[17790] A function of VGAM342 is therefore inhibition of Membrane Protein, Palmitoylated 2 (MAGUK p55 subfamily member 2) (MPP2, Accession XM\_008355). Accordingly, utilities of VGAM342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MPP2. RPP30 (Accession NM\_006413) is another VGAM342 host target gene. RPP30 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RPP30, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPP30 BINDING SITE, designated SEQ ID:13121, to the nucleotide sequence of VGAM342 RNA, herein designated VGAM RNA, also designated SEQ ID:3053.

[17791] Another function of VGAM342 is therefore inhibition of RPP30 (Accession NM\_006413), a gene which is a compo-

ment of ribonuclease p that processes 5' ends of precursor tRNAs. Accordingly, utilities of VGAM342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPP30. The function of RPP30 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM230. Tumor-associated Calcium Signal Transducer 2 (TACSTD2, Accession NM\_002353) is another VGAM342 host target gene. TACSTD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TACSTD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TACSTD2 BINDING SITE, designated SEQ ID:8158, to the nucleotide sequence of VGAM342 RNA, herein designated VGAM RNA, also designated SEQ ID:3053.

[17792] Another function of VGAM342 is therefore inhibition of Tumor-associated Calcium Signal Transducer 2 (TACSTD2, Accession NM\_002353), a gene which belongs to ga733 tumor-associated antigen gene family and may function as growth factor receptors. Accordingly, utilities

of VGAM342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TACSTD2. The function of TACSTD2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM210. Glutamate Receptor, Ionotropic, N-methyl-D-aspartate 3A (GRIN3A, Accession NM\_133445) is another VGAM342 host target gene. GRIN3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRIN3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRIN3A BINDING SITE, designated SEQ ID:28529, to the nucleotide sequence of VGAM342 RNA, herein designated VGAM RNA, also designated SEQ ID:3053.

[17793] Another function of VGAM342 is therefore inhibition of Glutamate Receptor, Ionotropic, N-methyl-D-aspartate 3A (GRIN3A, Accession NM\_133445). Accordingly, utilities of VGAM342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRIN3A. P5-1 (Accession NM\_006674) is another VGAM342 host target gene. P5-1 BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by P5-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P5-1 BINDING SITE, designated SEQ ID:13494, to the nucleotide sequence of VGAM342 RNA, herein designated VGAM RNA, also designated SEQ ID:3053.

[17794] Another function of VGAM342 is therefore inhibition of P5-1 (Accession NM\_006674). Accordingly, utilities of VGAM342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P5-1. POLD3 (Accession XM\_166243) is another VGAM342 host target gene. POLD3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by POLD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POLD3 BINDING SITE, designated SEQ ID:44054, to the nucleotide sequence of VGAM342 RNA, herein designated VGAM RNA, also designated SEQ ID:3053.

[17795] Another function of VGAM342 is therefore inhibition of

POLD3 (Accession XM\_166243). Accordingly, utilities of VGAM342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POLD3. LOC147639 (Accession XM\_085822) is another VGAM342 host target gene. LOC147639 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147639, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147639 BINDING SITE, designated SEQ ID:38347, to the nucleotide sequence of VGAM342 RNA, herein designated VGAM RNA, also designated SEQ ID:3053.

[17796] Another function of VGAM342 is therefore inhibition of LOC147639 (Accession XM\_085822). Accordingly, utilities of VGAM342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147639. LOC154282 (Accession XM\_098505) is another VGAM342 host target gene. LOC154282 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154282, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC154282 BINDING SITE, designated SEQ ID:41696, to the nucleotide sequence of VGAM342 RNA, herein designated VGAM RNA, also designated SEQ ID:3053.

[17797] Another function of VGAM342 is therefore inhibition of LOC154282 (Accession XM\_098505). Accordingly, utilities of VGAM342 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154282. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 343 (VGAM343) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17798] VGAM343 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM343 was detected is described hereinabove with reference to Figs. 1–8.

[17799] VGAM343 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tobacco Mosaic Virus. VGAM343 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[17800] VGAM343 gene encodes a VGAM343 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM343 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM343 precursor RNA is designated SEQ ID:329, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:329 is located at position 1903 relative to the genome of Tobacco Mosaic Virus.

[17801] VGAM343 precursor RNA folds onto itself, forming VGAM343 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17802] An enzyme complex designated DICER COMPLEX, `dices` the VGAM343 folded precursor RNA into VGAM343 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM343 RNA is designated SEQ ID:3054, and is provided hereinbelow with reference to the sequence listing part.

[17803] VGAM343 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM343 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM343 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[17804] VGAM343 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM343 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM343 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM343 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM343 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[17805] The complementary binding of VGAM343 RNA, herein designated VGAM RNA, to host target binding sites on VGAM343 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM343 host target RNA into VGAM343 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17806] It is appreciated that VGAM343 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM343 host target genes. The mRNA of each one of this plurality of VGAM343 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM343 RNA, herein designated VGAM RNA, and which when bound by VGAM343 RNA causes inhibition of translation of respective one or more VGAM343 host target proteins.

[17807] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM343 gene, herein designated VGAM GENE, on one or more VGAM343 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[17808] It is yet further appreciated that a function of VGAM343 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM343 include diagnosis, prevention and treatment of viral infection by Tobacco Mosaic Virus. Specific functions, and accordingly utilities, of VGAM343 correlate with, and may be deduced from, the identity of the host target genes which VGAM343 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17809] Nucleotide sequences of the VGAM343 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM343 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM343 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM343 are further described hereinbelow with reference to Table 1.

[17810] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM343 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM343 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17811] As mentioned hereinabove with reference to Fig. 1, a function of VGAM343 gene, herein designated VGAM is inhibition of expression of VGAM343 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM343 correlate with, and may be deduced from, the identity of the target genes which VGAM343 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17812] Immediate Early Response 5 (IER5, Accession NM\_016545) is a VGAM343 host target gene. IER5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IER5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IER5 BINDING SITE, designated SEQ ID:18611, to the nucleotide sequence of VGAM343 RNA, herein designated VGAM RNA, also designated SEQ ID:3054.

[17813] A function of VGAM343 is therefore inhibition of Immediate Early Response 5 (IER5, Accession NM\_016545), a gene which may play an important role in mediating the cellular response to mitogenic signals. Accordingly, utilities of VGAM343 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IER5. The function of IER5 has been established by previous studies. Williams et al. (1999) cloned a novel member of the slow-kinetics immediate-early response gene family, designated *Ier5*, from a mouse brain cDNA library. Mouse *Ier5* encodes a deduced 308-amino acid protein with a predicted molecular mass of 31.9 kD. The N-terminal 49 amino acids show 57% sequence identity with those of the *Ier2* protein. *Ier5* contains 3 potential nuclear targeting signals, a possible PEST sequence, which suggests rapid protein degradation, and several potential phosphorylation sites. Northern blot analysis of total cellular RNA from serum-starved NIH 3T3 cells showed no detectable transcription in quiescent cells, but detected a single transcript within 30 minutes after exposure to serum. Transcription was also stimulated by the growth factors TPA (OMIM Ref. No. 173370), FGF (see OMIM Ref. No. 131220), and PDGF (see OMIM Ref. No. 173430), and

did not appear to be dependent on protein kinase C (see OMIM Ref. No. 176960) activity. Williams et al. (1999) identified 2 possible Ets-1 sites, a number of potential Sp1 sites, and 3 potential AP1-binding sites in the promoter region of the mouse *Ier5* gene. The *IER5* genes in humans and mice are highly homologous to their counterpart in zebrafish. In all of these organisms, *IER5* is an intronless gene (Gottgens et al., 2002). The International Radiation Hybrid Mapping Consortium mapped the *IER5* gene to chromosome 1 (stSG23644).

[17814] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17815] Gottgens, B.; Barton, L. M.; Chapman, M. A.; Sinclair, A. M.; Knudsen, B.; Grafham, D.; Gilbert, J. G. R.; Rogers, J.; Bentley, D. R.; Green, A. R. : Transcriptional regulation of the stem cell leukemia gene (*SCL*)--comparative analysis of five vertebrate *SCL* loci. *Genome Res.* 12: 749-759, 2002. ; and

[17816] Williams, M.; Lyu, M.-S.; Yang, Y.-L.; Lin, E. P.; Dunbrack, R.; Birren, B.; Cunningham, J.; Hunter, K. : *Ier5*, a novel member of the slow-kinetics immediate-early genes. *Genomics* 55: 3.

[17817] Further studies establishing the function and utilities of IER5 are found in John Hopkins OMIM database record ID 607177, and in cited publications numbered 251 and 5542 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. LOC149535 (Accession XM\_086567) is another VGAM343 host target gene. LOC149535 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149535, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149535 BINDING SITE, designated SEQ ID:38770, to the nucleotide sequence of VGAM343 RNA, herein designated VGAM RNA, also designated SEQ ID:3054.

[17818] Another function of VGAM343 is therefore inhibition of LOC149535 (Accession XM\_086567). Accordingly, utilities of VGAM343 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149535. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 344 (VGAM344) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17819] VGAM344 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM344 was detected is described hereinabove with reference to Figs. 1–8.

[17820] VGAM344 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tobacco Mosaic Virus. VGAM344 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17821] VGAM344 gene encodes a VGAM344 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM344 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM344 precursor RNA is designated SEQ ID:330, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:330 is located at position 2117 relative to the genome of Tobacco Mosaic Virus.

[17822] VGAM344 precursor RNA folds onto itself, forming

VGAM344 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17823] An enzyme complex designated DICER COMPLEX, `dices` the VGAM344 folded precursor RNA into VGAM344 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM344 RNA is designated SEQ ID:3055, and is provided hereinbelow with reference to the sequence listing part.

[17824] VGAM344 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM344 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM344 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[17825] VGAM344 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM344 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM344 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM344 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM344 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[17826] The complementary binding of VGAM344 RNA, herein designated VGAM RNA, to host target binding sites on VGAM344 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM344 host target RNA into VGAM344 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17827] It is appreciated that VGAM344 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM344 host target genes. The mRNA of each one of this plurality of VGAM344 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM344 RNA, herein designated VGAM RNA, and which when bound by VGAM344 RNA causes inhibition of translation of respective one or more VGAM344 host target proteins.

[17828] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM344 gene, herein designated VGAM GENE, on one or more VGAM344 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[17829] It is yet further appreciated that a function of VGAM344 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM344 include diagnosis, prevention and treatment of viral infection by Tobacco Mosaic Virus. Specific functions, and accordingly utilities, of VGAM344 correlate with, and may be deduced from, the identity of the host target genes which VGAM344 binds and inhibits, and

the function of these host target genes, as elaborated hereinbelow.

[17830] Nucleotide sequences of the VGAM344 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM344 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM344 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM344 are further described hereinbelow with reference to Table 1.

[17831] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM344 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM344 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17832] As mentioned hereinabove with reference to Fig. 1, a function of VGAM344 gene, herein designated VGAM is inhibition of expression of VGAM344 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM344 correlate with, and may be deduced from, the identity of the target genes which VGAM344 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[17833] Fms-related Tyrosine Kinase 1 (vascular endothelial growth factor/vascular permeability factor receptor) (FLT1, Accession NM\_002019) is a VGAM344 host target gene. FLT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLT1 BINDING SITE, designated SEQ ID:7766, to the nucleotide sequence of VGAM344 RNA, herein designated VGAM RNA, also designated SEQ ID:3055.

[17834] A function of VGAM344 is therefore inhibition of Fms-related Tyrosine Kinase 1 (vascular endothelial growth factor/vascular permeability factor receptor) (FLT1, Accession NM\_002019). Accordingly, utilities of VGAM344 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLT1. Bladder Cancer Associated Protein (BLCAP, Accession NM\_006698) is another VGAM344 host target gene. BLCAP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BLCAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BLCAP BINDING SITE, designated SEQ ID:13518, to the nucleotide sequence of VGAM344 RNA, herein designated VGAM RNA, also designated SEQ ID:3055.

[17835] Another function of VGAM344 is therefore inhibition of Bladder Cancer Associated Protein (BLCAP, Accession NM\_006698). Accordingly, utilities of VGAM344 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BLCAP. KIAA0711 (Accession NM\_014867) is another VGAM344 host target gene. KIAA0711 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0711, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0711 BINDING SITE, designated SEQ ID:16954, to the nucleotide sequence of VGAM344 RNA, herein designated VGAM RNA, also designated SEQ ID:3055.

[17836] Another function of VGAM344 is therefore inhibition of KIAA0711 (Accession NM\_014867). Accordingly, utilities of VGAM344 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0711. LOC135293 (Accession XM\_072402) is another VGAM344 host target gene. LOC135293 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC135293, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC135293 BINDING SITE, designated SEQ ID:37491, to the nucleotide sequence of VGAM344 RNA, herein designated VGAM RNA, also designated SEQ ID:3055.

[17837] Another function of VGAM344 is therefore inhibition of LOC135293 (Accession XM\_072402). Accordingly, utilities of VGAM344 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC135293. LOC222962 (Accession XM\_167291) is another VGAM344 host target gene. LOC222962 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC222962, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222962 BINDING SITE, designated SEQ ID:44625, to

the nucleotide sequence of VGAM344 RNA, herein designated VGAM RNA, also designated SEQ ID:3055.

[17838] Another function of VGAM344 is therefore inhibition of LOC222962 (Accession XM\_167291). Accordingly, utilities of VGAM344 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222962. LOC92973 (Accession XM\_048529) is another VGAM344 host target gene. LOC92973 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92973, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92973 BINDING SITE, designated SEQ ID:35183, to the nucleotide sequence of VGAM344 RNA, herein designated VGAM RNA, also designated SEQ ID:3055.

[17839] Another function of VGAM344 is therefore inhibition of LOC92973 (Accession XM\_048529). Accordingly, utilities of VGAM344 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92973. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 345 (VGAM345) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17840] VGAM345 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM345 was detected is described hereinabove with reference to Figs. 1–8.

[17841] VGAM345 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Adenovirus C. VGAM345 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17842] VGAM345 gene encodes a VGAM345 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM345 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM345 precursor RNA is designated SEQ ID:331, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:331 is located at position 19970 relative to the genome of Human Adenovirus C.

[17843] VGAM345 precursor RNA folds onto itself, forming VGAM345 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17844] An enzyme complex designated DICER COMPLEX, `dices` the VGAM345 folded precursor RNA into VGAM345 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM345 RNA is designated SEQ ID:3056, and is provided hereinbelow with reference to the sequence listing part.

[17845] VGAM345 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM345 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM345 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[17846] VGAM345 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM345 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM345 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM345 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM345 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[17847] The complementary binding of VGAM345 RNA, herein designated VGAM RNA, to host target binding sites on VGAM345 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM345 host target RNA into VGAM345 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17848] It is appreciated that VGAM345 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM345 host target genes. The mRNA of each one of this plurality of VGAM345 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM345 RNA, herein designated VGAM RNA, and which when bound by VGAM345 RNA causes inhibition of translation of respective one or more VGAM345 host target proteins.

[17849] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM345 gene, herein designated VGAM GENE, on one or more VGAM345 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[17850] It is yet further appreciated that a function of VGAM345 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM345 include diagnosis, prevention and treatment of viral infection by Human Adenovirus C. Specific functions, and accordingly utilities, of VGAM345 correlate with, and may be deduced from, the identity of the

host target genes which VGAM345 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17851] Nucleotide sequences of the VGAM345 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM345 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM345 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM345 are further described hereinbelow with reference to Table 1.

[17852] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM345 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM345 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17853] As mentioned hereinabove with reference to Fig. 1, a function of VGAM345 gene, herein designated VGAM is inhibition of expression of VGAM345 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM345 correlate with, and may be deduced from, the identity of the target genes which VGAM345

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17854] Aryl–hydrocarbon Receptor Nuclear Translocator 2 (ARNT2, Accession NM\_014862) is a VGAM345 host target gene. ARNT2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ARNT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARNT2 BINDING SITE, designated SEQ ID:16933, to the nucleotide sequence of VGAM345 RNA, herein designated VGAM RNA, also designated SEQ ID:3056.

[17855] A function of VGAM345 is therefore inhibition of Aryl–hydrocarbon Receptor Nuclear Translocator 2 (ARNT2, Accession NM\_014862), a gene which specifically recognizes the xenobiotic response element (xre). Accordingly, utilities of VGAM345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARNT2. The function of ARNT2 has been established by previous studies. Hirose et al. (1996) determined that Arnt2 interacts with mouse AhR and Sim as efficiently as Arnt and that the Arnt2–AhR complex recognizes and

specifically binds the xenobiotic responsive element (XRE) sequence. In DNA transfection experiments, Arnt2 rescued XRE-driven reporter gene activity in Arnt mutant cells. RNA blot analysis detected restricted expression of Arnt2 in the brains and kidneys of adult mice, in contrast to the ubiquitous expression of Arnt. In situ hybridization experiments demonstrated expression of Arnt2 exclusively in the dorsal region of the spinal cord and branchial arch-1, whereas Arnt expression was broadly distributed in the ventral portion of the mesodermal and endodermal tissues. Animal model experiments lend further support to the function of ARNT2. To assess the role of ARNT2 in development and determine functional overlap with ARNT, Keith et al. (2001) generated a targeted null mutation of the murine Arnt2 locus. Arnt2  $-/-$  embryos died perinatally and exhibited impaired hypothalamic development, phenotypes previously observed for a targeted mutation in the murine Sim1 gene and consistent with the proposal by Michaud et al. (2000) that Arnt2 and Sim1 form an essential heterodimer in vivo. In addition, cultured Arnt2  $-/-$  neurons displayed decreased hypoxic induction of HIF1A target genes, demonstrating formally that ARNT2/HIF1A complexes regulate oxygen-responsive genes. Finally, a

strong genetic interaction between Arnt and Arnt2 mutations was observed, indicating that either gene can fulfill essential functions in a dose-dependent manner before embryonic day 8.5. These results demonstrated that Arnt and Arnt2 have both unique and overlapping essential functions in embryonic development.

[17856] It is appreciated that the abovementioned animal model for ARNT2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[17857] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17858] Hirose, K.; Morita, M.; Ema, M.; Mimura, J.; Hamada, H.; Fujii, H.; Saijo, Y.; Gotoh, O.; Sogawa, K.; Fujii-Kuriyama, Y. : cDNA cloning and tissue-specific expression of a novel basic helix-loop-helix/PAS factor (Arnt2) with close sequence similarity to the aryl hydrocarbon receptor nuclear translocator (Arnt). *Molec. Cell. Biol.* 16: 1706-1713, 1996. ; and

[17860] Further studies establishing the function and utilities of ARNT2 are found in John Hopkins OMIM database record ID 606036, and in cited publications numbered 6445–644 and 957 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RalA Binding Protein 1 (RALBP1, Accession NM\_006788) is another VGAM345 host target gene. RALBP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RALBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RALBP1 BINDING SITE, designated SEQ ID:13657, to the nucleotide sequence of VGAM345 RNA, herein designated VGAM RNA, also designated SEQ ID:3056.

[17861] Another function of VGAM345 is therefore inhibition of RalA Binding Protein 1 (RALBP1, Accession NM\_006788), a gene which plays a role in signal transduction and catalyzes the transport of glutathione conjugates and xenobiotics. Accordingly, utilities of VGAM345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RALBP1. The function of RALBP1

has been established by previous studies. Small G proteins have GDP-bound inactive and GTP-bound active forms; RAL proteins (e.g., RALA; 179550) shift from the inactive to the active state through the actions of RALGDS (OMIM Ref. No. 601619). RALGDS interacts with the active form of RAS (see OMIM Ref. No. HRAS; 190020). Using a mutant form of RALA lacking the C-terminal 27 amino acids as bait in a yeast 2-hybrid screen of a Jurkat cDNA library, followed by 5-prime RACE and screening skeletal muscle and placenta cDNA libraries, Jullien-Flores et al. (1995) obtained a cDNA encoding RALBP1, which they termed RLIP76. The deduced 655-amino acid protein is homologous in the central region to proteins bearing a CDC42 (OMIM Ref. No. 116952)/RHO (see OMIM Ref. No. 165390)/RAC (see OMIM Ref. No. RAC1; 602048) GTPase-activating protein (GAP) activity, such as BCR (see OMIM Ref. No. 151410). Sequence analysis predicted that RALBP1 has an N-terminal alpha-helical region, the GAP-like region, the RAL-binding region, and the C-terminal region. Binding analysis showed that RALBP1 interacts with RALA and RALB (OMIM Ref. No. 179551) but with no other GTPase except RAC1. Northern blot analysis detected ubiquitous, low-level expression of RALBP1.

[17862] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17863] Awasthi, S.; Cheng, J.; Singhal, S. S.; Saini, M. K.; Pandya, U.; Pikula, S.; Bandorowicz-Pikula, J.; Singh, S. V.; Zimniak, P.; Awasthi, Y. C. : Novel function of human RLIP76: ATP-dependent transport of glutathione conjugates and doxorubicin. *Biochemistry* 39: 9327–9334, 2000. ; and

[17864] Jullien-Flores, V.; Dorseuil, O.; Romero, R.; Letourneur, F.; Saragosti, S.; Berger, R.; Tavitian, A.; Gacon, G.; Camonis, J. H. : Bridging Ral GTPase to Rho pathways: RLIP76, a Ral ef.

[17865] Further studies establishing the function and utilities of RALBP1 are found in John Hopkins OMIM database record ID 605801, and in cited publications numbered 737–738 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. CSR1 (Accession NM\_016240) is another VGAM345 host target gene. CSR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CSR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

CSR1 BINDING SITE, designated SEQ ID:18356, to the nucleotide sequence of VGAM345 RNA, herein designated VGAM RNA, also designated SEQ ID:3056.

[17866] Another function of VGAM345 is therefore inhibition of CSR1 (Accession NM\_016240). Accordingly, utilities of VGAM345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSR1. KIAA0601 (Accession XM\_031267) is another VGAM345 host target gene. KIAA0601 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0601, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0601 BINDING SITE, designated SEQ ID:31326, to the nucleotide sequence of VGAM345 RNA, herein designated VGAM RNA, also designated SEQ ID:3056.

[17867] Another function of VGAM345 is therefore inhibition of KIAA0601 (Accession XM\_031267). Accordingly, utilities of VGAM345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0601. KIAA1505 (Accession XM\_168469) is another VGAM345 host target gene. KIAA1505 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1505, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1505 BINDING SITE, designated SEQ ID:45193, to the nucleotide sequence of VGAM345 RNA, herein designated VGAM RNA, also designated SEQ ID:3056.

[17868] Another function of VGAM345 is therefore inhibition of KIAA1505 (Accession XM\_168469). Accordingly, utilities of VGAM345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1505. MR (Accession NM\_031212) is another VGAM345 host target gene. MR BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MR BINDING SITE, designated SEQ ID:25256, to the nucleotide sequence of VGAM345 RNA, herein designated VGAM RNA, also designated SEQ ID:3056.

[17869] Another function of VGAM345 is therefore inhibition of

MR (Accession NM\_031212). Accordingly, utilities of VGAM345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MR. PTK6 Protein Tyrosine Kinase 6 (PTK6, Accession NM\_005975) is another VGAM345 host target gene. PTK6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PTK6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTK6 BINDING SITE, designated SEQ ID:12596, to the nucleotide sequence of VGAM345 RNA, herein designated VGAM RNA, also designated SEQ ID:3056.

[17870] Another function of VGAM345 is therefore inhibition of PTK6 Protein Tyrosine Kinase 6 (PTK6, Accession NM\_005975). Accordingly, utilities of VGAM345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTK6. Serine Palmitoyltransferase, Long Chain Base Subunit 2 (SPTLC2, Accession NM\_004863) is another VGAM345 host target gene. SPTLC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPTLC2, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPTLC2 BINDING SITE, designated SEQ ID:11272, to the nucleotide sequence of VGAM345 RNA, herein designated VGAM RNA, also designated SEQ ID:3056.

[17871] Another function of VGAM345 is therefore inhibition of Serine Palmitoyltransferase, Long Chain Base Subunit 2 (SPTLC2, Accession NM\_004863). Accordingly, utilities of VGAM345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPTLC2. UBX Domain Containing 2 (UBXD2, Accession XM\_043196) is another VGAM345 host target gene. UBXD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBXD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBXD2 BINDING SITE, designated SEQ ID:33912, to the nucleotide sequence of VGAM345 RNA, herein designated VGAM RNA, also designated SEQ ID:3056.

[17872] Another function of VGAM345 is therefore inhibition of UBX Domain Containing 2 (UBXD2, Accession

XM\_043196). Accordingly, utilities of VGAM345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBXD2. LOC112868 (Accession XM\_053402) is another VGAM345 host target gene. LOC112868 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC112868, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112868 BINDING SITE, designated SEQ ID:36075, to the nucleotide sequence of VGAM345 RNA, herein designated VGAM RNA, also designated SEQ ID:3056.

[17873] Another function of VGAM345 is therefore inhibition of LOC112868 (Accession XM\_053402). Accordingly, utilities of VGAM345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112868. LOC256176 (Accession XM\_172889) is another VGAM345 host target gene. LOC256176 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256176, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC256176 BINDING SITE, designated SEQ ID:46169, to the nucleotide sequence of VGAM345 RNA, herein designated VGAM RNA, also designated SEQ ID:3056.

[17874] Another function of VGAM345 is therefore inhibition of LOC256176 (Accession XM\_172889). Accordingly, utilities of VGAM345 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256176. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 346 (VGAM346) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17875] VGAM346 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM346 was detected is described hereinabove with reference to Figs. 1–8.

[17876] VGAM346 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Black Beetle Virus. VGAM346 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[17877] VGAM346 gene encodes a VGAM346 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM346 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM346 precursor RNA is designated SEQ ID:332, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:332 is located at position 1124 relative to the genome of Black Beetle Virus.

[17878] VGAM346 precursor RNA folds onto itself, forming VGAM346 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17879] An enzyme complex designated DICER COMPLEX, `dices` the VGAM346 folded precursor RNA into VGAM346 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM346 RNA is designated SEQ ID:3057, and is provided hereinbelow with reference to the sequence listing part.

[17880] VGAM346 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM346 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM346 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[17881] VGAM346 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM346 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM346 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM346 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM346 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[17882] The complementary binding of VGAM346 RNA, herein designated VGAM RNA, to host target binding sites on VGAM346 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM346 host target RNA into VGAM346 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17883] It is appreciated that VGAM346 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM346 host target genes. The mRNA of each one of this plurality of VGAM346 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM346 RNA, herein designated VGAM RNA, and which when bound by VGAM346 RNA causes inhibition of translation of respective one or more VGAM346 host target proteins.

[17884] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM346 gene, herein designated VGAM GENE, on one or more VGAM346 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[17885] It is yet further appreciated that a function of VGAM346 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM346 include diagnosis, prevention and treatment of viral infection by Black Beetle Virus. Specific functions, and accordingly utilities, of VGAM346 correlate with, and may be deduced from, the identity of the host target genes which VGAM346 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17886] Nucleotide sequences of the VGAM346 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM346 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM346 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM346 are further described hereinbelow with reference to Table 1.

[17887] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM346 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM346 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17888] As mentioned hereinabove with reference to Fig. 1, a function of VGAM346 gene, herein designated VGAM is inhibition of expression of VGAM346 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM346 correlate with, and may be deduced from, the identity of the target genes which VGAM346 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17889] Myosin ID (MYO1D, Accession XM\_050041) is a VGAM346 host target gene. MYO1D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYO1D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYO1D BINDING SITE, designated SEQ ID:35548, to the nucleotide sequence of VGAM346 RNA, herein designated VGAM RNA, also designated SEQ ID:3057.

[17890] A function of VGAM346 is therefore inhibition of Myosin ID (MYO1D, Accession XM\_050041), a gene which is an unconventional myosin. Accordingly, utilities of VGAM346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYO1D. The function of MYO1D and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM126. Osteoglycin (osteoinductive factor, mimecan) (OGN, Accession NM\_024416) is another VGAM346 host target gene. OGN BINDING SITE1 through OGN BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by OGN, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OGN BINDING SITE1 through OGN BINDING SITE3, designated SEQ ID:23655, SEQ ID:26899 and SEQ ID:15275 respectively, to the nucleotide sequence of VGAM346 RNA, herein designated VGAM RNA, also designated SEQ ID:3057.

[17891] Another function of VGAM346 is therefore inhibition of Osteoglycin (osteoinductive factor, mimecan) (OGN, Accession NM\_024416), a gene which induces ectopic bone

formation in conjunction with transforming growth factor beta. Accordingly, utilities of VGAM346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OGN. The function of OGN has been established by previous studies. Bovine osteoinductive factor (OIF) induces ectopic bone formation in conjunction with TGFB1 (OMIM Ref. No. 190180) or TGFB2 (OMIM Ref. No. 190220) (Bentz et al., 1989). Using primers based on the sequence of purified bovine OIF, Madisen et al. (1990) isolated a human OIF cDNA clone by RT-PCR of osteosarcoma cell mRNA. The human gene encodes a predicted 298-amino acid precursor protein that is processed into a 103-amino acid mature protein with 96% identity to the bovine protein. On Northern blots, 3 OIF mRNAs are found exclusively in 2 human osteosarcoma cell lines. By FISH, Tasheva et al. (2000) mapped the mimecan gene to 9q22. Pellegata et al. (2000) cloned the human OGN gene and mapped it to a region approximately 1.1 Mb telomeric of WI-532 and approximately 700 kb centromeric of D9S197 in 9q22.31.

[17892] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [17893] Madisen, L.; Neubauer, M.; Plowman, G.; Rosen, D.; Segarini, P.; Dasch, J.; Thompson, A.; Ziman, J.; Bentz, H.; Purchio, A. F. : Molecular cloning of a novel bone-forming compound: osteoinductive factor. DNA Cell Biol. 9: 303–309, 1990. ; and
- [17894] Pellegata, N. S.; Dieguez–Lucena, J. L.; Joensuu, T.; Lau, S.; Montgomery, K. T.; Krahe, R.; Kivela, T.; Kucherlapati, R.; Forsius, H.; de la Chapelle, A. : Mutations in KERA, encoding.
- [17895] Further studies establishing the function and utilities of OGN are found in John Hopkins OMIM database record ID 602383, and in cited publications numbered 5605–5606, 340 and 5861 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ30058 (Accession NM\_144967) is another VGAM346 host target gene. FLJ30058 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ30058, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ30058 BINDING SITE, designated SEQ ID:29581, to the nucleotide sequence of VGAM346 RNA, herein designated VGAM

RNA, also designated SEQ ID:3057.

[17896] Another function of VGAM346 is therefore inhibition of FLJ30058 (Accession NM\_144967). Accordingly, utilities of VGAM346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30058. KIAA0903 (Accession XM\_049251) is another VGAM346 host target gene. KIAA0903 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0903, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0903 BINDING SITE, designated SEQ ID:35370, to the nucleotide sequence of VGAM346 RNA, herein designated VGAM RNA, also designated SEQ ID:3057.

[17897] Another function of VGAM346 is therefore inhibition of KIAA0903 (Accession XM\_049251). Accordingly, utilities of VGAM346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0903. MNAB (Accession NM\_018835) is another VGAM346 host target gene. MNAB BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MNAB, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MNAB BINDING SITE, designated SEQ ID:20822, to the nucleotide sequence of VGAM346 RNA, herein designated VGAM RNA, also designated SEQ ID:3057.

[17898] Another function of VGAM346 is therefore inhibition of MNAB (Accession NM\_018835). Accordingly, utilities of VGAM346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MNAB. SCYD1 (Accession XM\_165650) is another VGAM346 host target gene. SCYD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCYD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCYD1 BINDING SITE, designated SEQ ID:43714, to the nucleotide sequence of VGAM346 RNA, herein designated VGAM RNA, also designated SEQ ID:3057.

[17899] Another function of VGAM346 is therefore inhibition of SCYD1 (Accession XM\_165650). Accordingly, utilities of VGAM346 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with SCYD1. LOC146445 (Accession XM\_096999) is another VGAM346 host target gene. LOC146445 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146445, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146445 BINDING SITE, designated SEQ ID:40700, to the nucleotide sequence of VGAM346 RNA, herein designated VGAM RNA, also designated SEQ ID:3057.

[17900] Another function of VGAM346 is therefore inhibition of LOC146445 (Accession XM\_096999). Accordingly, utilities of VGAM346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146445. LOC221103 (Accession XM\_167758) is another VGAM346 host target gene. LOC221103 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221103, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221103 BINDING SITE, designated SEQ ID:44780, to

the nucleotide sequence of VGAM346 RNA, herein designated VGAM RNA, also designated SEQ ID:3057.

[17901] Another function of VGAM346 is therefore inhibition of LOC221103 (Accession XM\_167758). Accordingly, utilities of VGAM346 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221103. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 347 (VGAM347) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17902] VGAM347 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM347 was detected is described hereinabove with reference to Figs. 1–8.

[17903] VGAM347 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Black Beetle Virus. VGAM347 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17904] VGAM347 gene encodes a VGAM347 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM347 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM347 precursor RNA is designated SEQ ID:333, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:333 is located at position 1731 relative to the genome of Black Beetle Virus.

[17905] VGAM347 precursor RNA folds onto itself, forming VGAM347 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17906] An enzyme complex designated DICER COMPLEX, `dices` the VGAM347 folded precursor RNA into VGAM347 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM347 RNA is designated SEQ ID:3058, and is provided hereinbelow with reference to the sequence listing part.

[17907] VGAM347 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM347 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM347 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[17908] VGAM347 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM347 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM347 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM347 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM347 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[17909] The complementary binding of VGAM347 RNA, herein designated VGAM RNA, to host target binding sites on VGAM347 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM347 host target RNA into VGAM347 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17910] It is appreciated that VGAM347 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM347 host target genes. The mRNA of each one of this plurality of VGAM347 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM347 RNA, herein designated VGAM RNA, and which when bound by VGAM347 RNA causes inhibition of translation of respective one or more VGAM347 host target proteins.

[17911] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM347 gene, herein designated VGAM GENE, on one or more VGAM347 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[17912] It is yet further appreciated that a function of VGAM347 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM347 include diagnosis, prevention and treatment of viral infection by Black Beetle Virus. Specific functions, and accordingly utilities, of VGAM347 correlate with, and may be deduced from, the identity of the host target genes which VGAM347 binds and inhibits, and the function of these host target genes, as elaborated herein–below.

[17913] Nucleotide sequences of the VGAM347 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM347 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM347 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM347 are further described hereinbelow with reference to Table 1.

[17914] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM347 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM347 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17915] As mentioned hereinabove with reference to Fig. 1, a function of VGAM347 gene, herein designated VGAM is inhibition of expression of VGAM347 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM347 correlate with, and may be deduced from, the identity of the target genes which VGAM347 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17916] Protein Tyrosine Phosphatase, Non-receptor Type 2 (PTPN2, Accession NM\_002828) is a VGAM347 host target gene. PTPN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPN2 BINDING SITE, designated SEQ ID:8705, to the nucleotide sequence of VGAM347 RNA, herein designated VGAM RNA, also designated SEQ ID:3058.

[17917] A function of VGAM347 is therefore inhibition of Protein

Tyrosine Phosphatase, Non-receptor Type 2 (PTPN2, Accession NM\_002828). Accordingly, utilities of VGAM347 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPN2. Chromosome 20 Open Reading Frame 108 (C20orf108, Accession NM\_080821) is another VGAM347 host target gene.

C20orf108 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf108, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf108 BINDING SITE, designated SEQ ID:28081, to the nucleotide sequence of VGAM347 RNA, herein designated VGAM RNA, also designated SEQ ID:3058.

[17918] Another function of VGAM347 is therefore inhibition of Chromosome 20 Open Reading Frame 108 (C20orf108, Accession NM\_080821). Accordingly, utilities of VGAM347 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf108. KIAA0884 (Accession XM\_046660) is another VGAM347 host target gene. KIAA0884 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by KIAA0884, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0884 BINDING SITE, designated SEQ ID:34773, to the nucleotide sequence of VGAM347 RNA, herein designated VGAM RNA, also designated SEQ ID:3058.

[17919] Another function of VGAM347 is therefore inhibition of KIAA0884 (Accession XM\_046660). Accordingly, utilities of VGAM347 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0884. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 16B (PPP1R16B, Accession XM\_028840) is another VGAM347 host target gene. PPP1R16B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1R16B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R16B BINDING SITE, designated SEQ ID:30765, to the nucleotide sequence of VGAM347 RNA, herein designated VGAM RNA, also designated SEQ ID:3058.

[17920] Another function of VGAM347 is therefore inhibition of

Protein Phosphatase 1, Regulatory (inhibitor) Subunit 16B (PPP1R16B, Accession XM\_028840). Accordingly, utilities of VGAM347 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R16B. LOC144100 (Accession XM\_084732) is another VGAM347 host target gene. LOC144100 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144100, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144100 BINDING SITE, designated SEQ ID:37676, to the nucleotide sequence of VGAM347 RNA, herein designated VGAM RNA, also designated SEQ ID:3058.

[17921] Another function of VGAM347 is therefore inhibition of LOC144100 (Accession XM\_084732). Accordingly, utilities of VGAM347 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144100. LOC145138 (Accession XM\_096724) is another VGAM347 host target gene. LOC145138 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145138, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145138 BINDING SITE, designated SEQ ID:40503, to the nucleotide sequence of VGAM347 RNA, herein designated VGAM RNA, also designated SEQ ID:3058.

[17922] Another function of VGAM347 is therefore inhibition of LOC145138 (Accession XM\_096724). Accordingly, utilities of VGAM347 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145138. LOC151234 (Accession XM\_087136) is another VGAM347 host target gene. LOC151234 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151234, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151234 BINDING SITE, designated SEQ ID:39079, to the nucleotide sequence of VGAM347 RNA, herein designated VGAM RNA, also designated SEQ ID:3058.

[17923] Another function of VGAM347 is therefore inhibition of LOC151234 (Accession XM\_087136). Accordingly, utilities of VGAM347 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC151234. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 348 (VGAM348) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17924] VGAM348 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM348 was detected is described hereinabove with reference to Figs. 1–8.

[17925] VGAM348 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Enterovirus C. VGAM348 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17926] VGAM348 gene encodes a VGAM348 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM348 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM348 precursor RNA is designated SEQ ID:334, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:334 is located at position 5074 relative to the genome of Human Enterovirus C.

[17927] VGAM348 precursor RNA folds onto itself, forming VGAM348 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17928] An enzyme complex designated DICER COMPLEX, `dices` the VGAM348 folded precursor RNA into VGAM348 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM348 RNA is designated SEQ ID:3059, and is provided hereinbelow with reference to the sequence listing part.

[17929] VGAM348 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM348 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM348 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[17930] VGAM348 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM348 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM348 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM348 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM348 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[17931] The complementary binding of VGAM348 RNA, herein designated VGAM RNA, to host target binding sites on VGAM348 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM348 host target RNA into VGAM348 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17932] It is appreciated that VGAM348 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM348 host target genes. The mRNA of each one of this plurality of VGAM348 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM348 RNA, herein designated VGAM RNA, and which when bound by VGAM348 RNA causes in-

hibition of translation of respective one or more VGAM348 host target proteins.

[17933] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM348 gene, herein designated VGAM GENE, on one or more VGAM348 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[17934] It is yet further appreciated that a function of VGAM348 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM348 include diagnosis, prevention and

treatment of viral infection by Human Enterovirus C. Specific functions, and accordingly utilities, of VGAM348 correlate with, and may be deduced from, the identity of the host target genes which VGAM348 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [17935] Nucleotide sequences of the VGAM348 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM348 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM348 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM348 are further described hereinbelow with reference to Table 1.
- [17936] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM348 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM348 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [17937] As mentioned hereinabove with reference to Fig. 1, a function of VGAM348 gene, herein designated VGAM is inhibition of expression of VGAM348 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM348 correlate with, and may be deduced from, the identity of the target genes which VGAM348 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17938] KIAA0828 (Accession XM\_088105) is a VGAM348 host target gene. KIAA0828 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0828, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0828 BINDING SITE, designated SEQ ID:39517, to the nucleotide sequence of VGAM348 RNA, herein designated VGAM RNA, also designated SEQ ID:3059.

[17939] A function of VGAM348 is therefore inhibition of KIAA0828 (Accession XM\_088105). Accordingly, utilities of VGAM348 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0828. LOC157909 (Accession XM\_088419) is another VGAM348 host target gene. LOC157909 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157909, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157909 BINDING SITE, designated SEQ ID:39678, to the nucleotide sequence of VGAM348 RNA, herein designated VGAM RNA, also designated SEQ ID:3059.

[17940] Another function of VGAM348 is therefore inhibition of LOC157909 (Accession XM\_088419). Accordingly, utilities of VGAM348 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157909. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 349 (VGAM349) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17941] VGAM349 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM349 was detected is described hereinabove with reference to Figs. 1–8.

[17942] VGAM349 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Enterovirus C.

VGAM349 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17943] VGAM349 gene encodes a VGAM349 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM349 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM349 precursor RNA is designated SEQ ID:335, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:335 is located at position 7103 relative to the genome of Human Enterovirus C.

[17944] VGAM349 precursor RNA folds onto itself, forming VGAM349 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17945] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM349 folded precursor RNA into VGAM349 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 63%) nucleotide sequence of VGAM349 RNA is designated SEQ ID:3060, and is provided hereinbelow with reference to the sequence listing part.

[17946] VGAM349 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM349 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM349 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[17947] VGAM349 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM349 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM349 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM349 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM349 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[17948] The complementary binding of VGAM349 RNA, herein designated VGAM RNA, to host target binding sites on VGAM349 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM349 host target RNA into VGAM349 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17949] It is appreciated that VGAM349 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM349 host target genes. The mRNA of each one of this plurality of VGAM349 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM349 RNA, herein designated VGAM RNA, and which when bound by VGAM349 RNA causes inhibition of translation of respective one or more VGAM349 host target proteins.

[17950] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM349 gene, herein designated VGAM GENE, on one or more VGAM349 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[17951] It is yet further appreciated that a function of VGAM349 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM349 include diagnosis, prevention and treatment of viral infection by Human Enterovirus C. Specific functions, and accordingly utilities, of VGAM349 correlate with, and may be deduced from, the identity of the host target genes which VGAM349 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17952] Nucleotide sequences of the VGAM349 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM349 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM349 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM349 are further described hereinbelow with reference to Table 1.

- [17953] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM349 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM349 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [17954] As mentioned hereinabove with reference to Fig. 1, a function of VGAM349 gene, herein designated VGAM is inhibition of expression of VGAM349 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM349 correlate with, and may be deduced from, the identity of the target genes which VGAM349 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [17955] Isocitrate Dehydrogenase 3 (NAD<sup>+</sup>) Alpha (IDH3A, Accession NM\_005530) is a VGAM349 host target gene. IDH3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IDH3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IDH3A BINDING SITE, designated SEQ ID:12053, to the

nucleotide sequence of VGAM349 RNA, herein designated VGAM RNA, also designated SEQ ID:3060.

[17956] A function of VGAM349 is therefore inhibition of Isocitrate Dehydrogenase 3 (NAD<sup>+</sup>) Alpha (IDH3A, Accession NM\_005530), a gene which decarboxylates isocitrate into alpha-ketoglutarate in the TCA cycle. Accordingly, utilities of VGAM349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IDH3A. The function of IDH3A has been established by previous studies. Isocitrate dehydrogenases (EC 1.1.1.4.1 and EC 1.1.1.42) catalyze the oxidative decarboxylation of isocitrate into alpha-ketoglutarate. Thus, they are key enzymes in the tricarboxylic acid (TCA) cycle. In mammalian tissues, 3 kinds of isoenzymes exist, cytosolic NADP(+)-specific IDH (OMIM Ref. No. 147700), mitochondrial NADP(+)-specific IDH (OMIM Ref. No. 147650), and mitochondrial NAD(+)-specific IDH (IDH3). Among the mammalian IDH isoenzymes, IDH3 is thought to play a major role in isocitrate decarboxylation in the TCA cycle, since its activity is regulated by numerous allosteric regulators. IDH3, purified to homogeneity from pig heart, is a heterotetramer of the 2-alpha, 1-beta, and 1-gamma subunits, while NADP(+)-specific IDH found in either mi-

tochondria or cytosol is a homodimer. Kim et al. (1995) characterized the cDNA clone for the alpha subunit (IDH3A), which encodes a mature protein with 339 amino acids (36,640 Da). Kim et al. (1995) had found that the human IDH3A sequence showed 44 and 30% amino acid identity to the monkey IDH3G (OMIM Ref. No. 602017) and bovine IDH2 (OMIM Ref. No. 147650) genes, respectively. Preliminary data using fluorescence in situ hybridization (FISH) supported the assignment to 15q26.1. By FISH, Huh et al. (1996) mapped the IDH3A gene to 15q25.1–q25.2

[17957] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17958] Huh, T.–L.; Kim, Y.–O.; Oh, I.–U.; Song, B. J.; Inazawa, J. : Assignment of the human mitochondrial NAD(+)-specific isocitrate dehydrogenase alpha subunit (IDH3A) gene to 15q25.1–q25.2 by in situ hybridization. Genomics 31: 295–296, 1996. ; and

[17959] Kim, Y.–O.; Oh, I.–U.; Park, H.–S.; Jeng, J.; Song, B. J.; Huh, T.–L. : Characterization of a cDNA clone for human NAD(+)-specific isocitrate dehydrogenase alpha-subunit and structural c.

[17960] Further studies establishing the function and utilities of IDH3A are found in John Hopkins OMIM database record ID 601149, and in cited publications numbered 7539–7540 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Lipin 1 (LPIN1, Accession XM\_041136) is another VGAM349 host target gene. LPIN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LPIN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LPIN1 BINDING SITE, designated SEQ ID:33470, to the nucleotide sequence of VGAM349 RNA, herein designated VGAM RNA, also designated SEQ ID:3060.

[17961] Another function of VGAM349 is therefore inhibition of Lipin 1 (LPIN1, Accession XM\_041136), a gene which is involved in adipocyte differentiation (by similarity). Accordingly, utilities of VGAM349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LPIN1. The function of LPIN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove

with reference to VGAM35.LIM Domain Containing Preferred Translocation Partner In Lipoma (LPP, Accession NM\_005578) is another VGAM349 host target gene. LPP BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LPP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LPP BINDING SITE, designated SEQ ID:12108, to the nucleotide sequence of VGAM349 RNA, herein designated VGAM RNA, also designated SEQ ID:3060.

[17962] Another function of VGAM349 is therefore inhibition of LIM Domain Containing Preferred Translocation Partner In Lipoma (LPP, Accession NM\_005578). Accordingly, utilities of VGAM349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LPP. Retinoschisis (X-linked, juvenile) 1 (RS1, Accession NM\_000330) is another VGAM349 host target gene. RS1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

RS1 BINDING SITE, designated SEQ ID:5879, to the nucleotide sequence of VGAM349 RNA, herein designated VGAM RNA, also designated SEQ ID:3060.

[17963] Another function of VGAM349 is therefore inhibition of Retinoschisis (X-linked, juvenile) 1 (RS1, Accession NM\_000330). Accordingly, utilities of VGAM349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RS1. Retinoid X Receptor, Alpha (RXRA, Accession NM\_002957) is another VGAM349 host target gene. RXRA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RXRA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RXRA BINDING SITE, designated SEQ ID:8873, to the nucleotide sequence of VGAM349 RNA, herein designated VGAM RNA, also designated SEQ ID:3060.

[17964] Another function of VGAM349 is therefore inhibition of Retinoid X Receptor, Alpha (RXRA, Accession NM\_002957), a gene which activates genes required for vitamin A metabolism, binds 9-cis retinoic acid. Accordingly, utilities of VGAM349 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with RXRA. The function of RXRA has been established by previous studies. Retinoic acid has been implicated in many aspects of vertebrate development and homeostasis. Its effects are mediated by specific nuclear receptor proteins that are members of the steroid and thyroid hormone receptor superfamily of transcriptional regulators. In addition to the high affinity retinoic acid receptors termed alpha (RARA; 180240), beta (RARB; 180220), and gamma (RARG; 180190), Mangelsdorf et al. (1990, 1991) identified a distinct nuclear receptor referred to as retinoid X receptor alpha. This receptor differs from the other 3 RARs within the ligand-binding domain and is incapable of high affinity binding of retinoic acid itself. The retinoic acid, thyroid hormone, and vitamin D receptors, as well as the retinoid X receptor, activate transcription from response elements containing 2 or more degenerate copies of the consensus motif AGGTCA. Heyman et al. (1992) presented evidence that 9-cis retinoic acid is a high affinity ligand for RXRA. McNamara et al. (2001) reported a hormone-dependent interaction of the nuclear receptors RARA and RXRA with CLOCK (OMIM Ref. No. 601851) and MOP4 (OMIM Ref. No. 603347). They found that these in-

teractions negatively regulate CLOCK–BMAL1 (OMIM Ref. No. 602550) and MOP4–BMAL1 heterodimer–mediated transcriptional activation of clock gene expression in vascular cells. MOP4 exhibited a robust rhythm in the vasculature, and retinoic acid could phase shift PER2 (OMIM Ref. No. 603426) mRNA rhythmicity in vivo and in serum-induced smooth muscle cells in vitro, providing a molecular mechanism for hormonal control of clock gene expression. McNamara et al. (2001) proposed that circadian or periodic availability of nuclear hormones may play a critical role in resetting a peripheral vascular clock. Using RFLVs in interspecific backcross mice, Hoopes et al. (1992) mapped mouse genomic loci *Rxra*, *Rxrb*, and *Rxrg* to chromosome 2 near the centromere, to the H-2 region of chromosome 17, and to distal chromosome 1 in tight linkage with the *Pbx* (OMIM Ref. No. 176310) gene, respectively. Jones et al. (1993) mapped the *RXRA* gene to chromosome 9 by using PCR on a panel of somatic cell hybrids. A cosmid clone was isolated using the *RXRA* PCR product, and this was used to localize the gene further by fluorescence in situ hybridization to 9q34, distal to the dopamine beta-hydroxylase gene (*DBH*; 223360). The mapping position was confirmed by PCR on a panel of

translocation hybrids. By pairwise hybridization of an RXRA cosmid and reference markers in fluorescence in situ hybridization, Almasan et al. (1994) refined the localization to 9q34.3. Fusion of PML (OMIM Ref. No. 102578) and TIF1A (OMIM Ref. No. 603406) to RARA and BRAF (OMIM Ref. No. 164757), respectively, results in the production of PML-RAR-alpha and TIF1-alpha-B-RAF (T18) oncoproteins. Zhong et al. (1999) showed that PML, TIF1-alpha, and RXR-alpha/RAR-alpha function together in a retinoic acid-dependent transcription complex. Zhong et al. (1999) found that PML acts as a ligand-dependent coactivator of RXR-alpha/RARA-alpha. T18, similar to PML-RAR-alpha, disrupts the retinoic acid-dependent activity of this complex in a dominant-negative manner, resulting in a growth advantage. PML-RAR-alpha was the first example of an oncoprotein generated by the fusion of 2 molecules participating in the same pathway, specifically the fusion of a transcription factor to one of its own cofactors. Since the PML and RAR-alpha pathways converge at the transcriptional level, there is no need for a double-dominant-negative product to explain the pathogenesis of acute promyelocytic leukemia, or APL. Germain et al. (2002) showed that RXR can bind ligand and recruit

coactivators as a heterodimer with apo-retinoic acid receptor (apo-RAR). However, in the usual cellular environment corepressors do not dissociate and they prohibit coactivator access because coregulator binding is mutually exclusive. Animal model experiments lend further support to the function of RXRA. Li et al. (2000) developed an efficient technique to create spatiotemporally controlled somatic mutations of the Rxr-alpha gene in the mouse. Li et al. (2000) used tamoxifen-inducible Cre-ER(T) recombinases to ablate RXR-alpha selectively in adult mouse keratinocytes. In 6 to 7 weeks after the first tamoxifen treatment, alopecia developed in the ventral region of pro-mutant mice. At 12 to 16 weeks after treatment, large regions of ventral skin and smaller regions of dorsal skin were hairless. Cysts became visible under the skin surface and these enlarged and spread all over the body with time. At 16 weeks after treatment, hairless regions showed hair follicle degeneration, resulting in utriculi and dermal cysts. Keratin 6 (OMIM Ref. No. 148041), which is usually expressed only in hair follicle outer root sheath, was also expressed in hyperproliferative interfollicular epidermis, indicating abnormal keratinocyte terminal differentiation. All abnormalities were less severe,

and/or appeared later, in males than in females. Li et al. (2000) found that RXR-beta (OMIM Ref. No. 180246) expression in adult skin is several-fold higher in males than in females. Study of tamoxifen-treated RXR-alpha/RXR-beta compound mutants demonstrated that RXR-beta can partially compensate for a loss of RXR-alpha function. Also, in accordance with a larger amount of RXR-beta in adult male skin, the functional redundancy was more pronounced in males than in females, as RXR-alpha/beta double mutant males and females were similarly affected, unlike the single mutants. De Urquiza et al. (2000) identified docosahexaenoic acid (DHA), a long-chain polyunsaturated fatty acid that is highly enriched in the adult mammalian brain, as the natural ligand for the retinoic X receptor in mouse brain. Claudel et al. (2001) analyzed the effects of activation of RXR and some of its heterodimers in apolipoprotein E -/- mice, a well-established animal model of atherosclerosis. An RXR agonist drastically reduced the development of atherosclerosis. In addition, a ligand for the peroxisome proliferator-activated receptor PPAR-gamma and a dual agonist of both PPAR-alpha and PPAR-gamma had moderate inhibitory effects. Both RXR and LXR agonists induced ATP-binding

cassette protein-1 (ABC1) expression and stimulated ABC1-mediated cholesterol efflux from macrophages from wildtype, but not from LXRA or LXR $\beta$  (OMIM Ref. No. 600380), double -/- mice. Hence, activation of ABC1-mediated cholesterol efflux by the RXR/LXR heterodimer may contribute to the beneficial effects of rexinoids on atherosclerosis and warrant further evaluation of RXR/LXR agonists in prevention and treatment of atherosclerosis.

[17965] It is appreciated that the abovementioned animal model for RXRA is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[17966] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

regulator recruitment and the mechanism of retinoic acid receptor synergy. *Nature* 415: 187–192, 2002.

[17969] Further studies establishing the function and utilities of RXRA are found in John Hopkins OMIM database record ID 180245, and in cited publications numbered 2726–2728, 5934–5935, 2724, 5936–5943, 2725, 5944–5945, 594 and 11302 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 6 Open Reading Frame 32 (C6orf32, Accession NM\_015864) is another VGAM349 host target gene. C6orf32 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C6orf32, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C6orf32 BINDING SITE, designated SEQ ID:17994, to the nucleotide sequence of VGAM349 RNA, herein designated VGAM RNA, also designated SEQ ID:3060.

[17970] Another function of VGAM349 is therefore inhibition of Chromosome 6 Open Reading Frame 32 (C6orf32, Accession NM\_015864). Accordingly, utilities of VGAM349 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with C6orf32. FLJ12221 (Accession XM\_031342) is another VGAM349 host target gene. FLJ12221 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12221, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12221 BINDING SITE, designated SEQ ID:31346, to the nucleotide sequence of VGAM349 RNA, herein designated VGAM RNA, also designated SEQ ID:3060.

[17971] Another function of VGAM349 is therefore inhibition of FLJ12221 (Accession XM\_031342). Accordingly, utilities of VGAM349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12221. FLJ20986 (Accession NM\_024524) is another VGAM349 host target gene. FLJ20986 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20986, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20986 BINDING SITE, designated SEQ ID:23731, to the nucleotide sequence of

VGAM349 RNA, herein designated VGAM RNA, also designated SEQ ID:3060.

[17972] Another function of VGAM349 is therefore inhibition of FLJ20986 (Accession NM\_024524). Accordingly, utilities of VGAM349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20986. HUMAGCGB (Accession NM\_013286) is another VGAM349 host target gene. HUMAGCGB BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HUMAGCGB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HUMAGCGB BINDING SITE, designated SEQ ID:14957, to the nucleotide sequence of VGAM349 RNA, herein designated VGAM RNA, also designated SEQ ID:3060.

[17973] Another function of VGAM349 is therefore inhibition of HUMAGCGB (Accession NM\_013286). Accordingly, utilities of VGAM349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HUMAGCGB. KIAA0831 (Accession NM\_014924) is another VGAM349 host target gene. KIAA0831 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA0831, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0831 BINDING SITE, designated SEQ ID:17211, to the nucleotide sequence of VGAM349 RNA, herein designated VGAM RNA, also designated SEQ ID:3060.

[17974] Another function of VGAM349 is therefore inhibition of KIAA0831 (Accession NM\_014924). Accordingly, utilities of VGAM349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0831. LOC129607 (Accession XM\_059368) is another VGAM349 host target gene. LOC129607 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC129607, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129607 BINDING SITE, designated SEQ ID:36973, to the nucleotide sequence of VGAM349 RNA, herein designated VGAM RNA, also designated SEQ ID:3060.

[17975] Another function of VGAM349 is therefore inhibition of LOC129607 (Accession XM\_059368). Accordingly, utilities

of VGAM349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129607. LOC150819 (Accession XM\_097954) is another VGAM349 host target gene. LOC150819 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150819, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150819 BINDING SITE, designated SEQ ID:41246, to the nucleotide sequence of VGAM349 RNA, herein designated VGAM RNA, also designated SEQ ID:3060.

[17976] Another function of VGAM349 is therefore inhibition of LOC150819 (Accession XM\_097954). Accordingly, utilities of VGAM349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150819. LOC152905 (Accession XM\_017966) is another VGAM349 host target gene. LOC152905 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152905, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC152905 BINDING SITE, designated SEQ ID:30334, to the nucleotide sequence of VGAM349 RNA, herein designated VGAM RNA, also designated SEQ ID:3060.

[17977] Another function of VGAM349 is therefore inhibition of LOC152905 (Accession XM\_017966). Accordingly, utilities of VGAM349 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152905. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 350 (VGAM350) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[17978] VGAM350 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM350 was detected is described hereinabove with reference to Figs. 1–8.

[17979] VGAM350 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Infectious Bronchitis Virus. VGAM350 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[17980] VGAM350 gene encodes a VGAM350 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM350 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM350 precursor RNA is designated SEQ ID:336, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:336 is located at position 2089 relative to the genome of Avian Infectious Bronchitis Virus.

[17981] VGAM350 precursor RNA folds onto itself, forming VGAM350 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[17982] An enzyme complex designated DICER COMPLEX, `dices` the VGAM350 folded precursor RNA into VGAM350 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM350 RNA is designated SEQ ID:3061, and is provided hereinbelow with reference to the sequence listing part.

[17983] VGAM350 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM350 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM350 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[17984] VGAM350 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM350 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM350 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM350 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM350 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[17985] The complementary binding of VGAM350 RNA, herein designated VGAM RNA, to host target binding sites on VGAM350 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM350 host target RNA into VGAM350 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[17986] It is appreciated that VGAM350 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM350 host target genes. The mRNA of each one of this plurality of VGAM350 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM350 RNA, herein designated VGAM RNA, and which when bound by VGAM350 RNA causes inhibition of translation of respective one or more VGAM350 host target proteins.

[17987] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM350 gene, herein designated VGAM GENE, on one or more VGAM350 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[17988] It is yet further appreciated that a function of VGAM350 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM350 include diagnosis, prevention and treatment of viral infection by Avian Infectious Bronchitis Virus. Specific functions, and accordingly utilities, of VGAM350 correlate with, and may be deduced from, the identity of the host target genes which VGAM350 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[17989] Nucleotide sequences of the VGAM350 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM350 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM350 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM350 are further described hereinbelow with reference to Table 1.

[17990] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM350 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM350 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[17991] As mentioned hereinabove with reference to Fig. 1, a function of VGAM350 gene, herein designated VGAM is inhibition of expression of VGAM350 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM350 correlate with, and may be deduced from, the identity of the target genes which VGAM350 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[17992] Coagulation Factor II (thrombin) Receptor-like 3 (F2RL3, Accession NM\_003950) is a VGAM350 host target gene. F2RL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by F2RL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of F2RL3 BINDING SITE, designated SEQ ID:10078, to the nucleotide sequence of VGAM350 RNA, herein designated VGAM RNA, also designated SEQ ID:3061.

[17993] A function of VGAM350 is therefore inhibition of Coagulation Factor II (thrombin) Receptor-like 3 (F2RL3, Accession NM\_003950), a gene which Protease-activated receptor 4; G protein-coupled receptor that increases phosphoinositide hydrolysis. Accordingly, utilities of VGAM350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F2RL3. The function of F2RL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM193. Sorting Nexin 6 (SNX6, Accession NM\_021249) is another VGAM350 host target gene. SNX6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SNX6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNX6 BINDING SITE, designated SEQ ID:22216, to the nucleotide sequence of VGAM350 RNA, herein designated VGAM RNA, also designated SEQ ID:3061.

[17994] Another function of VGAM350 is therefore inhibition of Sorting Nexin 6 (SNX6, Accession NM\_021249). Accordingly, utilities of VGAM350 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with SNX6. TIA1 Cytotoxic Granule-associated RNA Binding Protein-like 1 (TIAL1, Accession NM\_022333) is another VGAM350 host target gene. TIAL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIAL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIAL1 BINDING SITE, designated SEQ ID:22740, to the nucleotide sequence of VGAM350 RNA, herein designated VGAM RNA, also designated SEQ ID:3061.

[17995] Another function of VGAM350 is therefore inhibition of TIA1 Cytotoxic Granule-associated RNA Binding Protein-like 1 (TIAL1, Accession NM\_022333), a gene which possesses nucleolytic activity against cytotoxic lymphocyte target cells. Accordingly, utilities of VGAM350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIAL1. The function of TIAL1 has been established by previous studies. Cytotoxic lymphocytes can induce target cells to activate apoptosis. Central to this autolytic pathway is the activation of an endogenous endonuclease that degrades target cell DNA.

By screening a human phytohemagglutinin-activated T-cell cDNA library with a TIA1 (OMIM Ref. No. 603518) cDNA, Kawakami et al. (1992) cloned a cDNA encoding TIA1-related protein (TIAR). Both TIAR and TIA1 are members of a family of RNA-binding proteins containing 3 RNA-binding domains and a C-terminal auxiliary domain. Like TIA1, TIAR possesses a lysosome-targeting motif in its C-terminal auxiliary domain, suggesting that TIAR is also a cytotoxic granule-associated protein. The authors demonstrated that TIAR binds specifically to poly(A) homopolymers, fragments DNA in permeabilized target cells, and is expressed in a wide variety of hematopoietic and nonhematopoietic cell types. Using a Southwestern approach to identify proteins capable of binding to the T cluster of the platelet factor-4 (PF4; 173460) promoter, Doi et al. (1997) isolated a human erythroleukemia (HEL) cell cDNA encoding an isoform of TIAL1, which they called TCBP. This deduced 265-amino acid isoform differs from the isoform identified by Kawakami et al. (1992) at the C terminus, where a hydrophobic sequence replaces the lysosome-targeting motif. Doi et al. (1997) demonstrated that TCBP specifically binds to the T cluster and the proximal T-rich region of the PF4 promoter in vitro and that

TCBP reduces gene expression from the PF4 promoter.

TCBP mRNA expression was reduced when HEL cells were induced to differentiate to megakaryocytes.

[17996] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[17997] Kawakami, A.; Tian, Q.; Duan, X.; Streuli, M.; Schlossman, S. F.; Anderson, P. : Identification and functional characterization of a TIA-1-related nucleolysin. Proc. Nat. Acad. Sci. 89: 8681-8685, 1992. ; and

[17998] Doi, T.; Minami, T.; Itoh, M.; Aburatani, H.; Kawabe, Y.; Kodama, T.; Kondo, N.; Satoh, Y.; Asayama, T.; Imanishi, T. : An alternative form of nucleolysin binds to a T-cluster DNA in t.

[17999] Further studies establishing the function and utilities of TIAL1 are found in John Hopkins OMIM database record ID 603413, and in cited publications numbered 5294-5295 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Tumor Necrosis Factor (ligand) Superfamily, Member 15 (TNFSF15, Accession NM\_005118) is another VGAM350 host target gene. TNFSF15 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TN-

FSF15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFSF15 BINDING SITE, designated SEQ ID:11597, to the nucleotide sequence of VGAM350 RNA, herein designated VGAM RNA, also designated SEQ ID:3061.

[18000] Another function of VGAM350 is therefore inhibition of Tumor Necrosis Factor (ligand) Superfamily, Member 15 (TNFSF15, Accession NM\_005118), a gene which acts as an autocrine factor to induce apoptosis in endothelial cells. Accordingly, utilities of VGAM350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFSF15. The function of TNFSF15 has been established by previous studies. Zhai et al. (1999) found that expression of a recombinant soluble form of VEGF inhibited the growth of colon carcinomas in mice, and the tumors expressing the soluble VEGF had markedly reduced vascularization. Conditioned media from cells expressing soluble VEGF dramatically inhibited proliferation of bovine aortic endothelial cells. Zhai et al. (1999) concluded that VEGF is an angiogenesis inhibitor that functions in part by directly inhibiting endothelial cell

proliferation. Yue et al. (1999) reported that TL1 causes endothelial cell apoptosis via activation of the stress protein kinases SAPK/JNK (see OMIM Ref. No. 601158) and p38 MAPK (see OMIM Ref. No. 600289) and the caspases, primarily caspase-3 (OMIM Ref. No. 600636). By functional analysis, Migone et al. (2002) showed that TL1A, but not TL1, induces nuclear factor kappa-B (NFkB; OMIM Ref. No. 164011) activation in cells expressing DR3. Exposure of T lymphocytes, but not other cells, to TL1A enhanced IL2 receptor-alpha (IL2RA; 147730) and IL2 receptor-beta (IL2RB; 146710) expression on these cells, increased proliferation in response to IL2 (OMIM Ref. No. 147680), and induced secretion of IFNG and granulocyte-macrophage colony-stimulating factor (GMCSF, or CSF2; 138960), but not other cytokines, especially in the presence of anti-CD28 (OMIM Ref. No. 186760) costimulation. Exposure of an erythroleukemic cell line (TF-1), but not activated T cells, to TL1A induced caspase activation and cell death, particularly when protein synthesis was inhibited. Migone et al. (2002) showed that treatment of mice with recombinant TL1A strongly enhanced graft-versus-host reactivity, consistent with DR3 being mainly expressed on activated T cells.

- [18001] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [18002] Yue, T.-L.; Ni, J.; Romanic, A. M.; Gu, J.-L.; Keller, P.; Wang, C.; Kumar, S.; Yu, G.; Hart, T. K.; Wang, X.; Xia, Z.; DeWolf, W. E., Jr.; Feuerstein, G. Z. : TL1, a novel tumor necrosis factor-like cytokine, induces apoptosis in endothelial cells: involvement of activation of stress protein kinases (stress-activated protein kinase and p38 mitogen-activated protein kinase) and caspase-3-like protease. *J. Biol. Chem.* 274: 1479-1486, 1999. ; and

- [18004] Further studies establishing the function and utilities of TNFSF15 are found in John Hopkins OMIM database record ID 604052, and in cited publications numbered 232 and 8584 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Calneuron 1 (CALN1, Accession NM\_031468) is another VGAM350 host target gene. CALN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CALN1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CALN1 BINDING SITE, designated SEQ ID:25509, to the nucleotide sequence of VGAM350 RNA, herein designated VGAM RNA, also designated SEQ ID:3061.

[18005] Another function of VGAM350 is therefore inhibition of Calneuron 1 (CALN1, Accession NM\_031468). Accordingly, utilities of VGAM350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALN1. FLJ11053 (Accession XM\_114194) is another VGAM350 host target gene. FLJ11053 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11053, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11053 BINDING SITE, designated SEQ ID:42775, to the nucleotide sequence of VGAM350 RNA, herein designated VGAM RNA, also designated SEQ ID:3061.

[18006] Another function of VGAM350 is therefore inhibition of FLJ11053 (Accession XM\_114194). Accordingly, utilities of VGAM350 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ11053. FLJ11273 (Accession NM\_018374) is another VGAM350 host target gene. FLJ11273 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11273, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11273 BINDING SITE, designated SEQ ID:20391, to the nucleotide sequence of VGAM350 RNA, herein designated VGAM RNA, also designated SEQ ID:3061.

[18007] Another function of VGAM350 is therefore inhibition of FLJ11273 (Accession NM\_018374). Accordingly, utilities of VGAM350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11273. FLJ12700 (Accession NM\_024910) is another VGAM350 host target gene. FLJ12700 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12700, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12700 BINDING SITE, designated SEQ ID:24411, to the nucleotide sequence of

VGAM350 RNA, herein designated VGAM RNA, also designated SEQ ID:3061.

[18008] Another function of VGAM350 is therefore inhibition of FLJ12700 (Accession NM\_024910). Accordingly, utilities of VGAM350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12700. FLJ21736 (Accession NM\_024922) is another VGAM350 host target gene. FLJ21736 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21736, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21736 BINDING SITE, designated SEQ ID:24456, to the nucleotide sequence of VGAM350 RNA, herein designated VGAM RNA, also designated SEQ ID:3061.

[18009] Another function of VGAM350 is therefore inhibition of FLJ21736 (Accession NM\_024922). Accordingly, utilities of VGAM350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21736. Golgi Autoantigen, Golgin Subfamily A, 3 (GOLGA3, Accession NM\_005895) is another VGAM350 host target gene. GOLGA3 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by GOLGA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOLGA3 BINDING SITE, designated SEQ ID:12513, to the nucleotide sequence of VGAM350 RNA, herein designated VGAM RNA, also designated SEQ ID:3061.

[18010] Another function of VGAM350 is therefore inhibition of Golgi Autoantigen, Golgin Subfamily A, 3 (GOLGA3, Accession NM\_005895). Accordingly, utilities of VGAM350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLGA3. G Protein-coupled Receptor 64 (GPR64, Accession NM\_005756) is another VGAM350 host target gene. GPR64 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPR64, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR64 BINDING SITE, designated SEQ ID:12314, to the nucleotide sequence of VGAM350 RNA, herein designated VGAM RNA, also designated SEQ ID:3061.

[18011] Another function of VGAM350 is therefore inhibition of G Protein-coupled Receptor 64 (GPR64, Accession NM\_005756). Accordingly, utilities of VGAM350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR64. Hemogen (HEMGN, Accession NM\_018437) is another VGAM350 host target gene. HEMGN BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HEMGN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HEMGN BINDING SITE, designated SEQ ID:20498, to the nucleotide sequence of VGAM350 RNA, herein designated VGAM RNA, also designated SEQ ID:3061.

[18012] Another function of VGAM350 is therefore inhibition of Hemogen (HEMGN, Accession NM\_018437). Accordingly, utilities of VGAM350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEMGN. KIAA1200 (Accession XM\_031054) is another VGAM350 host target gene. KIAA1200 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1200, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1200 BINDING SITE, designated SEQ ID:31260, to the nucleotide sequence of VGAM350 RNA, herein designated VGAM RNA, also designated SEQ ID:3061.

[18013] Another function of VGAM350 is therefore inhibition of KIAA1200 (Accession XM\_031054). Accordingly, utilities of VGAM350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1200. KIAA1456 (Accession XM\_040100) is another VGAM350 host target gene. KIAA1456 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1456, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1456 BINDING SITE, designated SEQ ID:33260, to the nucleotide sequence of VGAM350 RNA, herein designated VGAM RNA, also designated SEQ ID:3061.

[18014] Another function of VGAM350 is therefore inhibition of KIAA1456 (Accession XM\_040100). Accordingly, utilities of VGAM350 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1456. KIAA1494 (Accession XM\_043561) is another VGAM350 host target gene. KIAA1494 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1494, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1494 BINDING SITE, designated SEQ ID:33960, to the nucleotide sequence of VGAM350 RNA, herein designated VGAM RNA, also designated SEQ ID:3061.

[18015] Another function of VGAM350 is therefore inhibition of KIAA1494 (Accession XM\_043561). Accordingly, utilities of VGAM350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1494. KIAA1508 (Accession XM\_030209) is another VGAM350 host target gene. KIAA1508 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1508, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1508 BINDING SITE, designated SEQ ID:30992, to the

nucleotide sequence of VGAM350 RNA, herein designated VGAM RNA, also designated SEQ ID:3061.

[18016] Another function of VGAM350 is therefore inhibition of KIAA1508 (Accession XM\_030209). Accordingly, utilities of VGAM350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1508. MGC5338 (Accession NM\_024062) is another VGAM350 host target gene. MGC5338 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC5338, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5338 BINDING SITE, designated SEQ ID:23497, to the nucleotide sequence of VGAM350 RNA, herein designated VGAM RNA, also designated SEQ ID:3061.

[18017] Another function of VGAM350 is therefore inhibition of MGC5338 (Accession NM\_024062). Accordingly, utilities of VGAM350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5338. NIFU (Accession XM\_041081) is another VGAM350 host target gene. NIFU BINDING SITE is HOST TARGET binding site found in the 5' untranslated region

of mRNA encoded by NIFU, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NIFU BINDING SITE, designated SEQ ID:33435, to the nucleotide sequence of VGAM350 RNA, herein designated VGAM RNA, also designated SEQ ID:3061.

[18018] Another function of VGAM350 is therefore inhibition of NIFU (Accession XM\_041081). Accordingly, utilities of VGAM350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NIFU. PB1 (Accession NM\_018165) is another VGAM350 host target gene. PB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PB1 BINDING SITE, designated SEQ ID:19977, to the nucleotide sequence of VGAM350 RNA, herein designated VGAM RNA, also designated SEQ ID:3061.

[18019] Another function of VGAM350 is therefore inhibition of PB1 (Accession NM\_018165). Accordingly, utilities of VGAM350 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with PB1. TA-PP2C (Accession NM\_139283) is another VGAM350 host target gene. TA-PP2C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TA-PP2C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TA-PP2C BINDING SITE, designated SEQ ID:29280, to the nucleotide sequence of VGAM350 RNA, herein designated VGAM RNA, also designated SEQ ID:3061.

[18020] Another function of VGAM350 is therefore inhibition of TA-PP2C (Accession NM\_139283). Accordingly, utilities of VGAM350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TA-PP2C. LOC128989 (Accession XM\_059310) is another VGAM350 host target gene. LOC128989 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC128989, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC128989 BINDING SITE, designated SEQ ID:36937, to the nucleotide se-

quence of VGAM350 RNA, herein designated VGAM RNA, also designated SEQ ID:3061.

[18021] Another function of VGAM350 is therefore inhibition of LOC128989 (Accession XM\_059310). Accordingly, utilities of VGAM350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128989. LOC150577 (Accession XM\_097918) is another VGAM350 host target gene. LOC150577 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150577, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150577 BINDING SITE, designated SEQ ID:41214, to the nucleotide sequence of VGAM350 RNA, herein designated VGAM RNA, also designated SEQ ID:3061.

[18022] Another function of VGAM350 is therefore inhibition of LOC150577 (Accession XM\_097918). Accordingly, utilities of VGAM350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150577. LOC256950 (Accession XM\_170922) is another VGAM350 host target gene. LOC256950 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC256950, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256950 BINDING SITE, designated SEQ ID:45700, to the nucleotide sequence of VGAM350 RNA, herein designated VGAM RNA, also designated SEQ ID:3061.

[18023] Another function of VGAM350 is therefore inhibition of LOC256950 (Accession XM\_170922). Accordingly, utilities of VGAM350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256950. LOC91263 (Accession XM\_037264) is another VGAM350 host target gene. LOC91263 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91263, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91263 BINDING SITE, designated SEQ ID:32593, to the nucleotide sequence of VGAM350 RNA, herein designated VGAM RNA, also designated SEQ ID:3061.

[18024] Another function of VGAM350 is therefore inhibition of LOC91263 (Accession XM\_037264). Accordingly, utilities

of VGAM350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91263. LOC91628 (Accession XM\_039701) is another VGAM350 host target gene. LOC91628 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91628, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91628 BINDING SITE, designated SEQ ID:33161, to the nucleotide sequence of VGAM350 RNA, herein designated VGAM RNA, also designated SEQ ID:3061.

[18025] Another function of VGAM350 is therefore inhibition of LOC91628 (Accession XM\_039701). Accordingly, utilities of VGAM350 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91628. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 351 (VGAM351) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18026] VGAM351 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM351 was detected is described hereinabove with reference to Figs. 1–8.

[18027] VGAM351 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Infectious Bronchitis Virus. VGAM351 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18028] VGAM351 gene encodes a VGAM351 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM351 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM351 precursor RNA is designated SEQ ID:337, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:337 is located at position 8232 relative to the genome of Avian Infectious Bronchitis Virus.

[18029] VGAM351 precursor RNA folds onto itself, forming VGAM351 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18030] An enzyme complex designated DICER COMPLEX, `dices` the VGAM351 folded precursor RNA into VGAM351 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM351 RNA is designated SEQ ID:3062, and is provided hereinbelow with reference to the sequence listing part.

[18031] VGAM351 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM351 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM351 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[18032] VGAM351 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM351 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM351 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM351 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM351 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18033] The complementary binding of VGAM351 RNA, herein designated VGAM RNA, to host target binding sites on VGAM351 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM351 host target RNA into VGAM351 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18034] It is appreciated that VGAM351 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM351 host target genes. The mRNA of each one of this plurality of VGAM351 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM351 RNA, herein designated VGAM RNA, and which when bound by VGAM351 RNA causes inhibition of translation of respective one or more VGAM351 host target proteins.

[18035] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM351 gene, herein designated VGAM GENE, on one or more VGAM351 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[18036] It is yet further appreciated that a function of VGAM351 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM351 include diagnosis, prevention and treatment of viral infection by Avian Infectious Bronchitis Virus. Specific functions, and accordingly utilities, of VGAM351 correlate with, and may be deduced from, the identity of the host target genes which VGAM351 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18037] Nucleotide sequences of the VGAM351 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM351 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM351 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM351 are further  
described hereinbelow with reference to Table 1.

[18038] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM351 host target RNA, and schematic  
representation of the complementarity of each of these  
host target binding sites to VGAM351 RNA, herein desig-  
nated VGAM RNA, are described hereinbelow with refer-  
ence to Table 2.

[18039] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM351 gene, herein designated VGAM is  
inhibition of expression of VGAM351 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM351 correlate with, and may be deduced  
from, the identity of the target genes which VGAM351  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[18040] Neuroblastoma RAS Viral (v-ras) Oncogene Homolog  
(NRAS, Accession NM\_002524) is a VGAM351 host target

gene. NRAS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NRAS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRAS BINDING SITE, designated SEQ ID:8359, to the nucleotide sequence of VGAM351 RNA, herein designated VGAM RNA, also designated SEQ ID:3062.

[18041] A function of VGAM351 is therefore inhibition of Neuroblastoma RAS Viral (v-ras) Oncogene Homolog (NRAS, Accession NM\_002524), a gene which ras proteins bind gdp/gtp and possess intrinsic gtpase activity. Accordingly, utilities of VGAM351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRAS. The function of NRAS has been established by previous studies. Hall et al. (1983) cloned an oncogene, which they termed N-RAS, from 2 human sarcoma cell lines, HT1080 and RD, and showed that it is a member of the RAS gene family; that it is encoded by a gene on chromosome 1; and that the same gene is activated in HL60, a promyelocytic leukemia line. Hall et al. (1983) settled on the designation NRAS 'after consultation with Wigler and with Weinberg.' De Martinville et al. (1984) assigned NRAS

to 1p31–cen. By in situ hybridization, Davis et al. (1983) assigned the NRAS gene to the short arm of chromosome 1. A concentration of grains was observed just above the centromere in band 1p13. They commented on the wide dispersion of the oncogenes in the RAS family; each of the 5 mapped to date was on a separate chromosome. Ryan et al. (1983) confirmed assignment of HRAS (OMIM Ref. No. 190020) to chromosome 11, KRAS2 (OMIM Ref. No. 190070) to chromosome 12, and NRAS1 to chromosome 1. Addendum in proof indicated that the same laboratory had assigned NRAS1 to 1p21–cen. The NRAS oncogene is distinct from the SK oncogene (OMIM Ref. No. 164780) in several characteristics (Balazs, 1983) and has a different location on chromosome 1. By somatic cell hybrid studies and by in situ hybridization, Rabin et al. (1984) assigned the NRAS gene to 1p11–p13. By in situ hybridization, Popescu et al. (1985) also assigned the NRAS locus to 1p11–p13. Povey et al. (1985) reviewed the conflicting evidence on the site of NRAS on 1p. They found evidence favoring both 1p22 and 1p12–p11. Dracopoli and Meisler (1990) concluded from linkage analysis and pulsed field gel electrophoresis that TSHB (OMIM Ref. No. 188540), NGFB (OMIM Ref. No. 162030), and NRAS form a tightly

linked gene cluster located in the same chromosomal band. Their location proximal to the AMY2B gene in 1p21 and close linkage to the alpha-satellite centromeric repeat D1Z5 provided strong evidence that the correct assignment for these 3 loci is 1p13 and not 1p22. Mitchell et al. (1995) localized NRAS to 1p13.2 and CD2 (OMIM Ref. No. 186990) and NGFB to 1p13.1. They concluded that the order is as follows: cen--CD2--NGFB--NRAS--tel. Using the allele-specific amplification method (ARMS), a highly sensitive 1-stage allele-specific PCR, Bezieau et al. (2001) evaluated the incidence of NRAS- and KRAS2-activating mutations (in codons 12, 13, and 61) in 62 patients with monoclonal gammopathy of undetermined significance (MGUS), multiple myeloma (MM), or primary plasma cell leukemia (PPCL), and in human myeloma cell lines (HMCL). Mutations in one or the other gene, or in both, were found in 54.5% of MM patients at diagnosis (but in 81% at the time of relapse), 50% of PPCL patients, and 50% of 16 HMCL patients. In contrast, the occurrence of such mutations was very low in MGUS and indolent MM (12.5%). KRAS2 mutations were always more frequent than NRAS mutations. Bezieau et al. (2001) concluded that these early mutations may play a major role in the oncogenesis

of multiple myeloid myeloma and primary plasma cell leukemia.

[18042] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18043] Bezieau, S.; Devilder, M.-C.; Avet-Loiseau, H.; Mellerin, M.-P.; Puthier, D.; Pennarun, E.; Rapp, M.-J.; Harousseau, J.-L.; Moisan, J.-P.; Bataille, R. : High incidence of N and K-Ras activating mutations in multiple myeloma and primary plasma cell leukemia at diagnosis. Hum. Mutat. 18: 212-224, 2001. ; and

[18044] Mitchell, E. L. D.; Jones, D.; White, G. R. M.; Varley, J. M.; Santibanez Koref, M. F. : Determination of the gene order of the three loci CD2, NGFB, and NRAS at human chromosome band.

[18045] Further studies establishing the function and utilities of NRAS are found in John Hopkins OMIM database record ID 164790, and in cited publications numbered 2257-2263, 12417-2266, 2238-2239, 2267-227 and 12743-12744 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. LOC154739 (Accession XM\_098602) is another VGAM351 host target gene. LOC154739 BINDING SITE is HOST TARGET binding

site found in the 5' untranslated region of mRNA encoded by LOC154739, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154739 BINDING SITE, designated SEQ ID:41714, to the nucleotide sequence of VGAM351 RNA, herein designated VGAM RNA, also designated SEQ ID:3062.

[18046] Another function of VGAM351 is therefore inhibition of LOC154739 (Accession XM\_098602). Accordingly, utilities of VGAM351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154739. LOC203276 (Accession XM\_117523) is another VGAM351 host target gene. LOC203276 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203276 BINDING SITE, designated SEQ ID:43481, to the nucleotide sequence of VGAM351 RNA, herein designated VGAM RNA, also designated SEQ ID:3062.

[18047] Another function of VGAM351 is therefore inhibition of

LOC203276 (Accession XM\_117523). Accordingly, utilities of VGAM351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203276. LOC203305 (Accession XM\_117529) is another VGAM351 host target gene. LOC203305 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203305, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203305 BINDING SITE, designated SEQ ID:43505, to the nucleotide sequence of VGAM351 RNA, herein designated VGAM RNA, also designated SEQ ID:3062.

[18048] Another function of VGAM351 is therefore inhibition of LOC203305 (Accession XM\_117529). Accordingly, utilities of VGAM351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203305. LOC254243 (Accession XM\_173233) is another VGAM351 host target gene. LOC254243 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254243, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC254243 BINDING SITE, designated SEQ ID:46507, to the nucleotide sequence of VGAM351 RNA, herein designated VGAM RNA, also designated SEQ ID:3062.

[18049] Another function of VGAM351 is therefore inhibition of LOC254243 (Accession XM\_173233). Accordingly, utilities of VGAM351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254243. LOC255870 (Accession XM\_170628) is another VGAM351 host target gene. LOC255870 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255870, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255870 BINDING SITE, designated SEQ ID:45405, to the nucleotide sequence of VGAM351 RNA, herein designated VGAM RNA, also designated SEQ ID:3062.

[18050] Another function of VGAM351 is therefore inhibition of LOC255870 (Accession XM\_170628). Accordingly, utilities of VGAM351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255870. LOC90038 (Accession XM\_028305) is an-

other VGAM351 host target gene. LOC90038 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90038, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90038 BINDING SITE, designated SEQ ID:30644, to the nucleotide sequence of VGAM351 RNA, herein designated VGAM RNA, also designated SEQ ID:3062.

[18051] Another function of VGAM351 is therefore inhibition of LOC90038 (Accession XM\_028305). Accordingly, utilities of VGAM351 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90038. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 352 (VGAM352) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18052] VGAM352 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM352 was detected is described

hereinabove with reference to Figs. 1–8.

[18053] VGAM352 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Infectious Bronchitis Virus. VGAM352 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18054] VGAM352 gene encodes a VGAM352 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM352 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM352 precursor RNA is designated SEQ ID:338, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:338 is located at position 4158 relative to the genome of Avian Infectious Bronchitis Virus.

[18055] VGAM352 precursor RNA folds onto itself, forming VGAM352 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18056] An enzyme complex designated DICER COMPLEX, `dices` the VGAM352 folded precursor RNA into VGAM352 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM352 RNA is designated SEQ ID:3063, and is provided hereinbelow with reference to the sequence listing part.

[18057] VGAM352 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM352 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM352 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18058] VGAM352 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM352 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM352 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM352 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM352 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18059] The complementary binding of VGAM352 RNA, herein designated VGAM RNA, to host target binding sites on VGAM352 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM352 host target RNA into VGAM352 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18060] It is appreciated that VGAM352 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM352 host target genes. The mRNA of each one of this plurality of VGAM352 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM352 RNA, herein designated VGAM RNA, and which when bound by VGAM352 RNA causes inhibition of translation of respective one or more VGAM352 host target proteins.

[18061] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM352 gene, herein designated VGAM GENE, on one or more VGAM352 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[18062] It is yet further appreciated that a function of VGAM352 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM352 include diagnosis, prevention and treatment of viral infection by Avian Infectious Bronchitis Virus. Specific functions, and accordingly utilities, of VGAM352 correlate with, and may be deduced from, the identity of the host target genes which VGAM352 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18063] Nucleotide sequences of the VGAM352 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM352 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM352 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM352 are further described hereinbelow with reference to Table 1.

[18064] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM352 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM352 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18065] As mentioned hereinabove with reference to Fig. 1, a function of VGAM352 gene, herein designated VGAM is inhibition of expression of VGAM352 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM352 correlate with, and may be deduced from, the identity of the target genes which VGAM352 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18066] AXL Receptor Tyrosine Kinase (AXL, Accession NM\_001699) is a VGAM352 host target gene. AXL BINDING SITE1 and AXL BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AXL, corresponding to HOST TARGET binding sites

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AXL BINDING SITE1 and AXL BINDING SITE2, designated SEQ ID:7425 and SEQ ID:22446 respectively, to the nucleotide sequence of VGAM352 RNA, herein designated VGAM RNA, also designated SEQ ID:3063.

[18067] A function of VGAM352 is therefore inhibition of AXL Receptor Tyrosine Kinase (AXL, Accession NM\_001699). Accordingly, utilities of VGAM352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AXL. FLJ20972 (Accession NM\_025030) is another VGAM352 host target gene. FLJ20972 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20972, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20972 BINDING SITE, designated SEQ ID:24627, to the nucleotide sequence of VGAM352 RNA, herein designated VGAM RNA, also designated SEQ ID:3063.

[18068] Another function of VGAM352 is therefore inhibition of FLJ20972 (Accession NM\_025030). Accordingly, utilities of VGAM352 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ20972. LOC200399 (Accession XM\_114226) is another VGAM352 host target gene. LOC200399 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200399, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200399 BINDING SITE, designated SEQ ID:42812, to the nucleotide sequence of VGAM352 RNA, herein designated VGAM RNA, also designated SEQ ID:3063.

[18069] Another function of VGAM352 is therefore inhibition of LOC200399 (Accession XM\_114226). Accordingly, utilities of VGAM352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200399. LOC90786 (Accession XM\_034127) is another VGAM352 host target gene. LOC90786 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90786, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90786 BINDING SITE, designated SEQ ID:32013, to the

nucleotide sequence of VGAM352 RNA, herein designated VGAM RNA, also designated SEQ ID:3063.

[18070] Another function of VGAM352 is therefore inhibition of LOC90786 (Accession XM\_034127). Accordingly, utilities of VGAM352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90786. LOC92267 (Accession XM\_043979) is another VGAM352 host target gene. LOC92267 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92267, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92267 BINDING SITE, designated SEQ ID:34057, to the nucleotide sequence of VGAM352 RNA, herein designated VGAM RNA, also designated SEQ ID:3063.

[18071] Another function of VGAM352 is therefore inhibition of LOC92267 (Accession XM\_043979). Accordingly, utilities of VGAM352 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92267. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 353 (VGAM353) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18072] VGAM353 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM353 was detected is described hereinabove with reference to Figs. 1–8.

[18073] VGAM353 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Infectious Bronchitis Virus. VGAM353 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18074] VGAM353 gene encodes a VGAM353 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM353 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM353 precursor RNA is designated SEQ ID:339, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:339 is located at position 6850 relative to the genome of Avian Infectious Bronchitis Virus.

[18075] VGAM353 precursor RNA folds onto itself, forming VGAM353 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18076] An enzyme complex designated DICER COMPLEX, `dices` the VGAM353 folded precursor RNA into VGAM353 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM353 RNA is designated SEQ ID:3064, and is provided hereinbelow with reference to the sequence listing part.

[18077] VGAM353 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM353 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM353 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18078] VGAM353 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM353 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM353 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM353 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM353 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18079] The complementary binding of VGAM353 RNA, herein designated VGAM RNA, to host target binding sites on VGAM353 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM353 host target RNA into VGAM353 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18080] It is appreciated that VGAM353 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM353 host target genes. The mRNA of each one of this plurality of VGAM353 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM353 RNA, herein designated VGAM RNA, and which when bound by VGAM353 RNA causes inhibition of translation of respective one or more VGAM353 host target proteins.

[18081] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM353 gene, herein designated VGAM GENE, on one or more VGAM353 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[18082] It is yet further appreciated that a function of VGAM353 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM353 include diagnosis, prevention and treatment of viral infection by Avian Infectious Bronchitis Virus. Specific functions, and accordingly utilities, of VGAM353 correlate with, and may be deduced from, the

identity of the host target genes which VGAM353 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18083] Nucleotide sequences of the VGAM353 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM353 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM353 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM353 are further described hereinbelow with reference to Table 1.

[18084] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM353 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM353 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18085] As mentioned hereinabove with reference to Fig. 1, a function of VGAM353 gene, herein designated VGAM is inhibition of expression of VGAM353 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM353 correlate with, and may be deduced from, the identity of the target genes which VGAM353

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18086] Golgi Associated, Gamma Adaptin Ear Containing, ARF Binding Protein 3 (GGA3, Accession NM\_014001) is a VGAM353 host target gene. GGA3 BINDING SITE1 and GGA3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GGA3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GGA3 BINDING SITE1 and GGA3 BINDING SITE2, designated SEQ ID:15197 and SEQ ID:28900 respectively, to the nucleotide sequence of VGAM353 RNA, herein designated VGAM RNA, also designated SEQ ID:3064.

[18087] A function of VGAM353 is therefore inhibition of Golgi Associated, Gamma Adaptin Ear Containing, ARF Binding Protein 3 (GGA3, Accession NM\_014001), a gene which may play a role in the regulation of membrane traffic through the trans-golgi network. Accordingly, utilities of VGAM353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GGA3. The function of GGA3 has been established by previous

studies. For general information on cloning and function of the GGA family, see the entry for GGA1 (OMIM Ref. No. 606004).

[18088] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18089] Doray, B.; Ghosh, P.; Griffith, J.; Geuze, H. J.; Kornfeld, S. : Cooperation of GGAs and AP-1 in packaging MPRs at the trans-Golgi network. Science 297: 1700-1703, 2002. ; and

[18090] Hirst, J.; Lui, W. W. Y.; Bright, N. A.; Totty, N.; Seaman, M. N. J.; Robinson, M. S. : A family of proteins with gamma-adaptin and VHS domains that facilitate trafficking between the.

[18091] Further studies establishing the function and utilities of GGA3 are found in John Hopkins OMIM database record ID 606006, and in cited publications numbered 4436, 1259 and 10969 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 20 Open Reading Frame 106 (C20orf106, Accession NM\_080824) is another VGAM353 host target gene. C20orf106 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of

mRNA encoded by C20orf106, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf106 BINDING SITE, designated SEQ ID:28091, to the nucleotide sequence of VGAM353 RNA, herein designated VGAM RNA, also designated SEQ ID:3064.

[18092] Another function of VGAM353 is therefore inhibition of Chromosome 20 Open Reading Frame 106 (C20orf106, Accession NM\_080824). Accordingly, utilities of VGAM353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf106. Epiregulin (EREG, Accession NM\_001432) is another VGAM353 host target gene. EREG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EREG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EREG BINDING SITE, designated SEQ ID:7155, to the nucleotide sequence of VGAM353 RNA, herein designated VGAM RNA, also designated SEQ ID:3064.

[18093] Another function of VGAM353 is therefore inhibition of

Epiregulin (EREG, Accession NM\_001432). Accordingly, utilities of VGAM353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EREG. KIAA1046 (Accession NM\_014928) is another VGAM353 host target gene. KIAA1046 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1046, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1046 BINDING SITE, designated SEQ ID:17217, to the nucleotide sequence of VGAM353 RNA, herein designated VGAM RNA, also designated SEQ ID:3064.

[18094] Another function of VGAM353 is therefore inhibition of KIAA1046 (Accession NM\_014928). Accordingly, utilities of VGAM353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1046. Mitochondrial Ribosomal Protein L20 (MRPL20, Accession NM\_017971) is another VGAM353 host target gene. MRPL20 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MRPL20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of MRPL20 BINDING SITE, designated SEQ ID:19698, to the nucleotide sequence of VGAM353 RNA, herein designated VGAM RNA, also designated SEQ ID:3064.

[18095] Another function of VGAM353 is therefore inhibition of Mitochondrial Ribosomal Protein L20 (MRPL20, Accession NM\_017971). Accordingly, utilities of VGAM353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL20. NTT73 (Accession NM\_018057) is another VGAM353 host target gene. NTT73 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NTT73, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NTT73 BINDING SITE, designated SEQ ID:19824, to the nucleotide sequence of VGAM353 RNA, herein designated VGAM RNA, also designated SEQ ID:3064.

[18096] Another function of VGAM353 is therefore inhibition of NTT73 (Accession NM\_018057). Accordingly, utilities of VGAM353 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with NTT73. Protein O-fucosyltransferase 1 (POFUT1, Accession XM\_047011) is another VGAM353 host target gene. POFUT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by POFUT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POFUT1 BINDING SITE, designated SEQ ID:34884, to the nucleotide sequence of VGAM353 RNA, herein designated VGAM RNA, also designated SEQ ID:3064.

[18097] Another function of VGAM353 is therefore inhibition of Protein O-fucosyltransferase 1 (POFUT1, Accession XM\_047011). Accordingly, utilities of VGAM353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POFUT1. LOC146237 (Accession XM\_096954) is another VGAM353 host target gene. LOC146237 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of LOC146237 BINDING SITE, designated SEQ ID:40664, to the nucleotide sequence of VGAM353 RNA, herein designated VGAM RNA, also designated SEQ ID:3064.

[18098] Another function of VGAM353 is therefore inhibition of LOC146237 (Accession XM\_096954). Accordingly, utilities of VGAM353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146237. LOC148562 (Accession XM\_086240) is another VGAM353 host target gene. LOC148562 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148562, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148562 BINDING SITE, designated SEQ ID:38566, to the nucleotide sequence of VGAM353 RNA, herein designated VGAM RNA, also designated SEQ ID:3064.

[18099] Another function of VGAM353 is therefore inhibition of LOC148562 (Accession XM\_086240). Accordingly, utilities of VGAM353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148562. LOC200197 (Accession XM\_114148) is an-

other VGAM353 host target gene. LOC200197 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200197, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200197 BINDING SITE, designated SEQ ID:42732, to the nucleotide sequence of VGAM353 RNA, herein designated VGAM RNA, also designated SEQ ID:3064.

[18100] Another function of VGAM353 is therefore inhibition of LOC200197 (Accession XM\_114148). Accordingly, utilities of VGAM353 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200197. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 354 (VGAM354) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18101] VGAM354 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM354 was detected is described

hereinabove with reference to Figs. 1–8.

[18102] VGAM354 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Infectious Bronchitis Virus. VGAM354 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18103] VGAM354 gene encodes a VGAM354 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM354 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM354 precursor RNA is designated SEQ ID:340, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:340 is located at position 7380 relative to the genome of Avian Infectious Bronchitis Virus.

[18104] VGAM354 precursor RNA folds onto itself, forming VGAM354 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18105] An enzyme complex designated DICER COMPLEX, `dices` the VGAM354 folded precursor RNA into VGAM354 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM354 RNA is designated SEQ ID:3065, and is provided hereinbelow with reference to the sequence listing part.

[18106] VGAM354 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM354 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM354 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18107] VGAM354 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM354 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM354 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM354 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM354 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18108] The complementary binding of VGAM354 RNA, herein designated VGAM RNA, to host target binding sites on VGAM354 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM354 host target RNA into VGAM354 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18109] It is appreciated that VGAM354 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM354 host target genes. The mRNA of each one of this plurality of VGAM354 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM354 RNA, herein designated VGAM RNA, and which when bound by VGAM354 RNA causes inhibition of translation of respective one or more VGAM354 host target proteins.

[18110] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM354 gene, herein designated VGAM GENE, on one or more VGAM354 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[18111] It is yet further appreciated that a function of VGAM354 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM354 include diagnosis, prevention and treatment of viral infection by Avian Infectious Bronchitis Virus. Specific functions, and accordingly utilities, of VGAM354 correlate with, and may be deduced from, the identity of the host target genes which VGAM354 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18112] Nucleotide sequences of the VGAM354 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM354 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM354 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM354 are further described hereinbelow with reference to Table 1.

[18113] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM354 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM354 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18114] As mentioned hereinabove with reference to Fig. 1, a function of VGAM354 gene, herein designated VGAM is inhibition of expression of VGAM354 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM354 correlate with, and may be deduced from, the identity of the target genes which VGAM354 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18115] Myotubularin Related Protein 2 (MTMR2, Accession NM\_016156) is a VGAM354 host target gene. MTMR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MTMR2, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTMR2 BINDING SITE, designated SEQ ID:18242, to the nucleotide sequence of VGAM354 RNA, herein designated VGAM RNA, also designated SEQ ID:3065.

[18116] A function of VGAM354 is therefore inhibition of Myotubularin Related Protein 2 (MTMR2, Accession NM\_016156). Accordingly, utilities of VGAM354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTMR2. Baculoviral IAP Repeat-containing 1 (BIRC1, Accession NM\_004536) is another VGAM354 host target gene. BIRC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BIRC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BIRC1 BINDING SITE, designated SEQ ID:10880, to the nucleotide sequence of VGAM354 RNA, herein designated VGAM RNA, also designated SEQ ID:3065.

[18117] Another function of VGAM354 is therefore inhibition of Baculoviral IAP Repeat-containing 1 (BIRC1, Accession NM\_004536). Accordingly, utilities of VGAM354 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with BIRC1. Death-associated Protein Kinase 2 (DAPK2, Accession NM\_014326) is another VGAM354 host target gene. DAPK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAPK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAPK2 BINDING SITE, designated SEQ ID:15633, to the nucleotide sequence of VGAM354 RNA, herein designated VGAM RNA, also designated SEQ ID:3065.

[18118] Another function of VGAM354 is therefore inhibition of Death-associated Protein Kinase 2 (DAPK2, Accession NM\_014326). Accordingly, utilities of VGAM354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAPK2. FLJ20128 (Accession NM\_017679) is another VGAM354 host target gene. FLJ20128 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20128, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of FLJ20128 BINDING SITE, designated SEQ ID:19221, to the nucleotide sequence of VGAM354 RNA, herein designated VGAM RNA, also designated SEQ ID:3065.

[18119] Another function of VGAM354 is therefore inhibition of FLJ20128 (Accession NM\_017679). Accordingly, utilities of VGAM354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20128. Olfactory Receptor, Family 2, Subfamily C, Member 3 (OR2C3, Accession XM\_060575) is another VGAM354 host target gene. OR2C3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OR2C3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OR2C3 BINDING SITE, designated SEQ ID:37174, to the nucleotide sequence of VGAM354 RNA, herein designated VGAM RNA, also designated SEQ ID:3065.

[18120] Another function of VGAM354 is therefore inhibition of Olfactory Receptor, Family 2, Subfamily C, Member 3 (OR2C3, Accession XM\_060575). Accordingly, utilities of VGAM354 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with OR2C3. RAP2B, Member of RAS Oncogene Family (RAP2B, Accession XM\_171061) is another VGAM354 host target gene. RAP2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAP2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAP2B BINDING SITE, designated SEQ ID:45859, to the nucleotide sequence of VGAM354 RNA, herein designated VGAM RNA, also designated SEQ ID:3065.

[18121] Another function of VGAM354 is therefore inhibition of RAP2B, Member of RAS Oncogene Family (RAP2B, Accession XM\_171061). Accordingly, utilities of VGAM354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAP2B. RODH-4 (Accession NM\_003708) is another VGAM354 host target gene. RODH-4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RODH-4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of RODH-4 BINDING SITE, designated SEQ ID:9806, to the nucleotide sequence of VGAM354 RNA, herein designated VGAM RNA, also designated SEQ ID:3065.

[18122] Another function of VGAM354 is therefore inhibition of RODH-4 (Accession NM\_003708). Accordingly, utilities of VGAM354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RODH-4. LOC151742 (Accession NM\_139245) is another VGAM354 host target gene. LOC151742 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151742, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151742 BINDING SITE, designated SEQ ID:29241, to the nucleotide sequence of VGAM354 RNA, herein designated VGAM RNA, also designated SEQ ID:3065.

[18123] Another function of VGAM354 is therefore inhibition of LOC151742 (Accession NM\_139245). Accordingly, utilities of VGAM354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151742. LOC219529 (Accession XM\_167563) is an-

other VGAM354 host target gene. LOC219529 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219529, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219529 BINDING SITE, designated SEQ ID:44675, to the nucleotide sequence of VGAM354 RNA, herein designated VGAM RNA, also designated SEQ ID:3065.

[18124] Another function of VGAM354 is therefore inhibition of LOC219529 (Accession XM\_167563). Accordingly, utilities of VGAM354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219529. LOC90459 (Accession XM\_031826) is another VGAM354 host target gene. LOC90459 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90459, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90459 BINDING SITE, designated SEQ ID:31491, to the nucleotide sequence of VGAM354 RNA, herein designated VGAM RNA, also designated SEQ ID:3065.

[18125] Another function of VGAM354 is therefore inhibition of LOC90459 (Accession XM\_031826). Accordingly, utilities of VGAM354 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90459. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 355 (VGAM355) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18126] VGAM355 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM355 was detected is described hereinabove with reference to Figs. 1–8.

[18127] VGAM355 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Infectious Bronchitis Virus. VGAM355 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18128] VGAM355 gene encodes a VGAM355 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM355

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM355 precursor RNA is designated SEQ ID:341, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:341 is located at position 931 relative to the genome of Avian Infectious Bronchitis Virus.

[18129] VGAM355 precursor RNA folds onto itself, forming VGAM355 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18130] An enzyme complex designated DICER COMPLEX, `dices` the VGAM355 folded precursor RNA into VGAM355 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 47%) nucleotide sequence of VGAM355 RNA is designated SEQ ID:3066, and is provided hereinbelow with reference to the sequence listing part.

[18131] VGAM355 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM355 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM355 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18132] VGAM355 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM355 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM355 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM355 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM355 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18133] The complementary binding of VGAM355 RNA, herein designated VGAM RNA, to host target binding sites on VGAM355 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM355 host target RNA into VGAM355 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18134] It is appreciated that VGAM355 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM355 host target genes. The mRNA of each one of this plurality of VGAM355 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM355 RNA, herein designated VGAM RNA, and which when bound by VGAM355 RNA causes inhibition of translation of respective one or more VGAM355 host target proteins.

[18135] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM355 gene, herein designated VGAM GENE, on one or more VGAM355 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[18136] It is yet further appreciated that a function of VGAM355 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of viral infection by Avian Infectious Bronchitis Virus. Specific functions, and accordingly utilities, of VGAM355 correlate with, and may be deduced from, the identity of the host target genes which VGAM355 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18137] Nucleotide sequences of the VGAM355 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM355 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM355 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM355 are further described hereinbelow with reference to Table 1.

[18138] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM355 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM355 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[18139] As mentioned hereinabove with reference to Fig. 1, a function of VGAM355 gene, herein designated VGAM is inhibition of expression of VGAM355 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM355 correlate with, and may be deduced from, the identity of the target genes which VGAM355 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18140] B-cell CLL/lymphoma 7A (BCL7A, Accession NM\_020993) is a VGAM355 host target gene. BCL7A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL7A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL7A BINDING SITE, designated SEQ ID:21987, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:3066.

[18141] A function of VGAM355 is therefore inhibition of B-cell CLL/lymphoma 7A (BCL7A, Accession NM\_020993). Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions as-

sociated with BCL7A. Macrophage Scavenger Receptor 1 (MSR1, Accession NM\_138715) is another VGAM355 host target gene. MSR1 BINDING SITE1 and MSR1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MSR1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSR1 BINDING SITE1 and MSR1 BINDING SITE2, designated SEQ ID:28961 and SEQ ID:28963 respectively, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:3066.

[18142] Another function of VGAM355 is therefore inhibition of Macrophage Scavenger Receptor 1 (MSR1, Accession NM\_138715), a gene which plays a role in endocytosis of macromolecules. Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSR1. The function of MSR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM176. Vacuolar Protein Sorting 41 (yeast) (VPS41, Accession NM\_014396) is another VGAM355 host target

gene. VPS41 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by VPS41, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VPS41 BINDING SITE, designated SEQ ID:15736, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:3066.

[18143] Another function of VGAM355 is therefore inhibition of Vacuolar Protein Sorting 41 (yeast) (VPS41, Accession NM\_014396). Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VPS41. KIAA1538 (Accession XM\_049474) is another VGAM355 host target gene. KIAA1538 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1538 BINDING SITE, designated SEQ ID:35435, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ

ID:3066.

[18144] Another function of VGAM355 is therefore inhibition of KIAA1538 (Accession XM\_049474). Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1538. KIAA1712 (Accession XM\_041497) is another VGAM355 host target gene. KIAA1712 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1712, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1712 BINDING SITE, designated SEQ ID:33538, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:3066.

[18145] Another function of VGAM355 is therefore inhibition of KIAA1712 (Accession XM\_041497). Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1712. KIAA1906 (Accession XM\_055095) is another VGAM355 host target gene. KIAA1906 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1906, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1906 BINDING SITE, designated SEQ ID:36232, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:3066.

[18146] Another function of VGAM355 is therefore inhibition of KIAA1906 (Accession XM\_055095). Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1906. Paternally Expressed 10 (PEG10, Accession NM\_015068) is another VGAM355 host target gene. PEG10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PEG10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEG10 BINDING SITE, designated SEQ ID:17426, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:3066.

[18147] Another function of VGAM355 is therefore inhibition of Paternally Expressed 10 (PEG10, Accession NM\_015068).

Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEG10. Solute Carrier Family 2 (facilitated glucose transporter), Member 10 (SLC2A10, Accession NM\_030777) is another VGAM355 host target gene. SLC2A10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC2A10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC2A10 BINDING SITE, designated SEQ ID:25064, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:3066.

[18148] Another function of VGAM355 is therefore inhibition of Solute Carrier Family 2 (facilitated glucose transporter), Member 10 (SLC2A10, Accession NM\_030777). Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC2A10. LOC143153 (Accession XM\_084440) is another VGAM355 host target gene. LOC143153 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143153, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143153 BINDING SITE, designated SEQ ID:37582, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:3066.

[18149] Another function of VGAM355 is therefore inhibition of LOC143153 (Accession XM\_084440). Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143153. LOC143154 (Accession XM\_084441) is another VGAM355 host target gene. LOC143154 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143154, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143154 BINDING SITE, designated SEQ ID:37588, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:3066.

[18150] Another function of VGAM355 is therefore inhibition of LOC143154 (Accession XM\_084441). Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC143154. LOC144289 (Accession XM\_096565) is another VGAM355 host target gene. LOC144289 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144289, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144289 BINDING SITE, designated SEQ ID:40398, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:3066.

[18151] Another function of VGAM355 is therefore inhibition of LOC144289 (Accession XM\_096565). Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144289. LOC219294 (Accession XM\_167566) is another VGAM355 host target gene. LOC219294 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC219294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219294 BINDING SITE, designated SEQ ID:44689, to

the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:3066.

[18152] Another function of VGAM355 is therefore inhibition of LOC219294 (Accession XM\_167566). Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219294. LOC219295 (Accession XM\_167565) is another VGAM355 host target gene. LOC219295 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219295, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219295 BINDING SITE, designated SEQ ID:44683, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:3066.

[18153] Another function of VGAM355 is therefore inhibition of LOC219295 (Accession XM\_167565). Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219295. LOC91170 (Accession XM\_036612) is another VGAM355 host target gene. LOC91170 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC91170, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91170 BINDING SITE, designated SEQ ID:32479, to the nucleotide sequence of VGAM355 RNA, herein designated VGAM RNA, also designated SEQ ID:3066.

[18154] Another function of VGAM355 is therefore inhibition of LOC91170 (Accession XM\_036612). Accordingly, utilities of VGAM355 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91170. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 356 (VGAM356) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18155] VGAM356 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM356 was detected is described hereinabove with reference to Figs. 1–8.

[18156] VGAM356 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Avian Infectious Bronchitis Virus. VGAM356 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18157] VGAM356 gene encodes a VGAM356 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM356 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM356 precursor RNA is designated SEQ ID:342, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:342 is located at position 6336 relative to the genome of Avian Infectious Bronchitis Virus.

[18158] VGAM356 precursor RNA folds onto itself, forming VGAM356 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18159] An enzyme complex designated DICER COMPLEX, `dices` the VGAM356 folded precursor RNA into VGAM356 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM356 RNA is designated SEQ ID:3067, and is provided hereinbelow with reference to the sequence listing part.

[18160] VGAM356 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM356 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM356 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18161] VGAM356 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM356 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM356 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM356 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM356 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18162] The complementary binding of VGAM356 RNA, herein designated VGAM RNA, to host target binding sites on VGAM356 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM356 host tar-

get RNA into VGAM356 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18163] It is appreciated that VGAM356 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM356 host target genes. The mRNA of each one of this plurality of VGAM356 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM356 RNA, herein designated VGAM RNA, and which when bound by VGAM356 RNA causes inhibition of translation of respective one or more VGAM356 host target proteins.

[18164] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM356 gene, herein designated VGAM GENE, on one or more VGAM356 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[18165] It is yet further appreciated that a function of VGAM356 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of viral infection by Avian Infectious Bronchitis Virus. Specific functions, and accordingly utilities, of VGAM356 correlate with, and may be deduced from, the identity of the host target genes which VGAM356 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18166] Nucleotide sequences of the VGAM356 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM356 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM356 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM356 are further

described hereinbelow with reference to Table 1.

[18167] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM356 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM356 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18168] As mentioned hereinabove with reference to Fig. 1, a function of VGAM356 gene, herein designated VGAM is inhibition of expression of VGAM356 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM356 correlate with, and may be deduced from, the identity of the target genes which VGAM356 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18169] CDC-like Kinase 2 (CLK2, Accession NM\_001291) is a VGAM356 host target gene. CLK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLK2 BINDING SITE,

designated SEQ ID:6971, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:3067.

[18170] A function of VGAM356 is therefore inhibition of CDC-like Kinase 2 (CLK2, Accession NM\_001291), a gene which catalyzes the phosphorylation of proteins. Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLK2. The function of CLK2 has been established by previous studies. The protein kinases are a family of enzymes that catalyze the phosphorylation of proteins and are classified according to the amino acid that acts as the phosphate acceptor. Hanes et al. (1994) cloned human ovarian follicle cDNAs encoding the novel serine/threonine kinase CLK2 based on their high sequence identity to human and mouse protein kinase CLK1 (CLK; 601951) cDNAs. The authors identified 2 alternative CLK2 cDNAs of different lengths that represent differentially spliced CLK2 transcripts; these mRNAs coexist at varying ratios in human prostate, testis, leukocytes, and muscle. The longer CLK2 cDNA encodes a predicted 499-amino acid protein that has a nonconserved N-terminal domain, a highly conserved C-terminal kinase domain, and multiple

potential phosphorylation sites. This CLK2 isoform has 61% and 56% sequence identity with the CLK3 (OMIM Ref. No. 602990) and CLK1 proteins, respectively. The shorter cDNA contains an internal deletion corresponding to an 88-bp exon, resulting in a predicted 139-amino acid protein that lacks the kinase domain. Southern blot analysis of human genomic DNA suggested that CLK2 is a single-copy gene. Nothwang et al. (2001) reported a translocation t(1;19)(q21.3;q13.2) in a female with mental retardation, ataxia, and atrophy of the brain. Sequence analysis of the breakpoints revealed an Alu repeat-mediated mechanism of recombination that led to truncation of CLK2 and PAFAH1B3 (OMIM Ref. No. 603074), the gene product of which interacts with LIS1 (OMIM Ref. No. 601545) as part of the heterotrimeric G protein complex PAFAH1B. One expressed fusion gene encoded the first 136 amino acids of PAFAH1B3, followed by the complete CLK2 protein. Truncated PAFAH1B3 protein lost its potential to interact with LIS1, whereas CLK2 activity was conserved within the fusion protein. These data emphasized the importance of PAFAH1B in brain development and function.

[18171] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [18172] Hanes, J.; von der Kammer, H.; Klaudiny, J.; Scheit, K. H. : Characterization by cDNA cloning of two new human protein kinases: evidence by sequence comparison of a new family of mammalian protein kinases. J. Molec. Biol. 244: 665–672, 1994. ; and
- [18173] Nothwang, H. G.; Kim, H. G.; Aoki, J.; Geisterfer, M.; Kubart, S.; Wegner, R. D.; van Moers, A.; Ashworth, L. K.; Haaf, T.; Bell, J.; Arai, H.; Tommerup, N.; Ropers, H. H.; Wirth, J. .:
- [18174] Further studies establishing the function and utilities of CLK2 are found in John Hopkins OMIM database record ID 602989, and in cited publications numbered 669 and 6700 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Eukaryotic Translation Initiation Factor 2C, 1 (EIF2C1, Accession NM\_012199) is another VGAM356 host target gene. EIF2C1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF2C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of EIF2C1 BINDING SITE, designated SEQ ID:14498, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:3067.

[18175] Another function of VGAM356 is therefore inhibition of Eukaryotic Translation Initiation Factor 2C, 1 (EIF2C1, Accession NM\_012199), a gene which plays an important role in the eukaryotic peptide chain initiation process. Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF2C1. The function of EIF2C1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM118. Fms-related Tyrosine Kinase 1 (vascular endothelial growth factor/vascular permeability factor receptor) (FLT1, Accession NM\_002019) is another VGAM356 host target gene. FLT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLT1 BINDING SITE, designated SEQ ID:7762, to the nucleotide sequence

of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:3067.

[18176] Another function of VGAM356 is therefore inhibition of Fms-related Tyrosine Kinase 1 (vascular endothelial growth factor/vascular permeability factor receptor) (FLT1, Accession NM\_002019). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLT1. Homeo Box D4 (HOXD4, Accession NM\_014621) is another VGAM356 host target gene. HOXD4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HOXD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXD4 BINDING SITE, designated SEQ ID:15976, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:3067.

[18177] Another function of VGAM356 is therefore inhibition of Homeo Box D4 (HOXD4, Accession NM\_014621), a gene which is part of a developmental regulatory system. Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions as-

sociated with HOXD4. The function of HOXD4 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM330. Myelin Oligodendrocyte Glycoprotein (MOG, Accession NM\_002433) is another VGAM356 host target gene. MOG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MOG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MOG BINDING SITE, designated SEQ ID:8277, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:3067.

[18178] Another function of VGAM356 is therefore inhibition of Myelin Oligodendrocyte Glycoprotein (MOG, Accession NM\_002433). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MOG. Sal-like 2 (Drosophila) (SALL2, Accession XM\_033473) is another VGAM356 host target gene. SALL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SALL2, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SALL2 BINDING SITE, designated SEQ ID:31934, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:3067.

[18179] Another function of VGAM356 is therefore inhibition of Sal-like 2 (Drosophila) (SALL2, Accession XM\_033473). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SALL2. Chromosome 20 Open Reading Frame 130 (C20orf130, Accession XM\_029741) is another VGAM356 host target gene. C20orf130 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf130, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf130 BINDING SITE, designated SEQ ID:30933, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:3067.

[18180] Another function of VGAM356 is therefore inhibition of Chromosome 20 Open Reading Frame 130 (C20orf130,

Accession XM\_029741). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf130. Chromosome 8 Open Reading Frame 17 (C8orf17, Accession NM\_020237) is another VGAM356 host target gene.

C8orf17 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C8orf17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C8orf17 BINDING SITE, designated SEQ ID:21505, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:3067.

[18181] Another function of VGAM356 is therefore inhibition of Chromosome 8 Open Reading Frame 17 (C8orf17, Accession NM\_020237). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C8orf17. Calcium/calmodulin-dependent Protein Kinase Kinase 2, Beta (CAMKK2, Accession NM\_006549) is another VGAM356 host target gene. CAMKK2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA

encoded by CAMKK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAMKK2 BINDING SITE, designated SEQ ID:13308, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:3067.

[18182] Another function of VGAM356 is therefore inhibition of Calcium/calmodulin-dependent Protein Kinase Kinase 2, Beta (CAMKK2, Accession NM\_006549). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMKK2. DIM1 (Accession NM\_006701) is another VGAM356 host target gene. DIM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DIM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DIM1 BINDING SITE, designated SEQ ID:13524, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:3067.

[18183] Another function of VGAM356 is therefore inhibition of

DIM1 (Accession NM\_006701). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIM1. Elongation of Very Long Chain Fatty Acids (FEN1/Elo2, SUR4/Elo3, yeast)-like 2 (ELOVL2, Accession NM\_017770) is another VGAM356 host target gene. ELOVL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ELOVL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELOVL2 BINDING SITE, designated SEQ ID:19386, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:3067.

[18184] Another function of VGAM356 is therefore inhibition of Elongation of Very Long Chain Fatty Acids (FEN1/Elo2, SUR4/Elo3, yeast)-like 2 (ELOVL2, Accession NM\_017770). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELOVL2. FLJ14440 (Accession NM\_032784) is another VGAM356 host target gene. FLJ14440 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

FLJ14440, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14440 BINDING SITE, designated SEQ ID:26530, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:3067.

[18185] Another function of VGAM356 is therefore inhibition of FLJ14440 (Accession NM\_032784). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14440. FLJ21687 (Accession NM\_024859) is another VGAM356 host target gene. FLJ21687 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21687, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21687 BINDING SITE, designated SEQ ID:24288, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:3067.

[18186] Another function of VGAM356 is therefore inhibition of FLJ21687 (Accession NM\_024859). Accordingly, utilities of

VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21687. KIAA0798 (Accession NM\_014650) is another VGAM356 host target gene. KIAA0798 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0798, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0798 BINDING SITE, designated SEQ ID:16065, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:3067.

[18187] Another function of VGAM356 is therefore inhibition of KIAA0798 (Accession NM\_014650). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0798. KIAA1404 (Accession XM\_030494) is another VGAM356 host target gene. KIAA1404 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1404, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1404 BINDING SITE, designated SEQ ID:31047, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:3067.

[18188] Another function of VGAM356 is therefore inhibition of KIAA1404 (Accession XM\_030494). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1404. KIAA1456 (Accession XM\_040100) is another VGAM356 host target gene. KIAA1456 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1456, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1456 BINDING SITE, designated SEQ ID:33261, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:3067.

[18189] Another function of VGAM356 is therefore inhibition of KIAA1456 (Accession XM\_040100). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1456. KIAA1580 (Accession XM\_045271) is another VGAM356 host target gene. KIAA1580 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1580, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1580 BINDING SITE, designated SEQ ID:34404, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:3067.

[18190] Another function of VGAM356 is therefore inhibition of KIAA1580 (Accession XM\_045271). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1580. KIAA1950 (Accession XM\_166532) is another VGAM356 host target gene. KIAA1950 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1950, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1950 BINDING SITE, designated SEQ ID:44482, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:3067.

[18191] Another function of VGAM356 is therefore inhibition of

KIAA1950 (Accession XM\_166532). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1950. MYLE (Accession NM\_014015) is another VGAM356 host target gene. MYLE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYLE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYLE BINDING SITE, designated SEQ ID:15233, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:3067.

[18192] Another function of VGAM356 is therefore inhibition of MYLE (Accession NM\_014015). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYLE. Peptidyl Arginine Deiminase, Type I (PADI1, Accession XM\_030498) is another VGAM356 host target gene. PADI1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PADI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of PADI1 BINDING SITE, designated SEQ ID:31053, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:3067.

[18193] Another function of VGAM356 is therefore inhibition of Peptidyl Arginine Deiminase, Type I (PADI1, Accession XM\_030498). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PADI1. Solute Carrier Family 17 (sodium-dependent inorganic phosphate cotransporter), Member 6 (SLC17A6, Accession NM\_020346) is another VGAM356 host target gene. SLC17A6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC17A6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC17A6 BINDING SITE, designated SEQ ID:21594, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:3067.

[18194] Another function of VGAM356 is therefore inhibition of Solute Carrier Family 17 (sodium-dependent inorganic phosphate cotransporter), Member 6 (SLC17A6, Accession

NM\_020346). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC17A6. LOC116411 (Accession XM\_058095) is another VGAM356 host target gene. LOC116411 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC116411, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC116411 BINDING SITE, designated SEQ ID:36564, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:3067.

[18195] Another function of VGAM356 is therefore inhibition of LOC116411 (Accession XM\_058095). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116411. LOC143308 (Accession XM\_096411) is another VGAM356 host target gene. LOC143308 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143308, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC143308 BINDING SITE, designated SEQ ID:40346, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:3067.

[18196] Another function of VGAM356 is therefore inhibition of LOC143308 (Accession XM\_096411). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143308. LOC145384 (Accession XM\_085128) is another VGAM356 host target gene. LOC145384 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145384, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145384 BINDING SITE, designated SEQ ID:37860, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:3067.

[18197] Another function of VGAM356 is therefore inhibition of LOC145384 (Accession XM\_085128). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145384. LOC85479 (Accession NM\_033105) is an-

other VGAM356 host target gene. LOC85479 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC85479, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC85479 BINDING SITE, designated SEQ ID:26956, to the nucleotide sequence of VGAM356 RNA, herein designated VGAM RNA, also designated SEQ ID:3067.

[18198] Another function of VGAM356 is therefore inhibition of LOC85479 (Accession NM\_033105). Accordingly, utilities of VGAM356 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC85479. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 357 (VGAM357) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18199] VGAM357 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM357 was detected is described

hereinabove with reference to Figs. 1–8.

[18200] VGAM357 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Infectious Bronchitis Virus. VGAM357 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18201] VGAM357 gene encodes a VGAM357 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM357 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM357 precursor RNA is designated SEQ ID:343, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:343 is located at position 1864 relative to the genome of Avian Infectious Bronchitis Virus.

[18202] VGAM357 precursor RNA folds onto itself, forming VGAM357 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18203] An enzyme complex designated DICER COMPLEX, `dices` the VGAM357 folded precursor RNA into VGAM357 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM357 RNA is designated SEQ ID:3068, and is provided hereinbelow with reference to the sequence listing part.

[18204] VGAM357 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM357 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM357 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18205] VGAM357 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM357 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM357 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM357 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM357 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18206] The complementary binding of VGAM357 RNA, herein designated VGAM RNA, to host target binding sites on VGAM357 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM357 host target RNA into VGAM357 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18207] It is appreciated that VGAM357 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM357 host target genes. The mRNA of each one of this plurality of VGAM357 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM357 RNA, herein designated VGAM RNA, and which when bound by VGAM357 RNA causes inhibition of translation of respective one or more VGAM357 host target proteins.

[18208] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM357 gene, herein designated VGAM GENE, on one or more VGAM357 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[18209] It is yet further appreciated that a function of VGAM357 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM357 include diagnosis, prevention and treatment of viral infection by Avian Infectious Bronchitis Virus. Specific functions, and accordingly utilities, of VGAM357 correlate with, and may be deduced from, the identity of the host target genes which VGAM357 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18210] Nucleotide sequences of the VGAM357 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM357 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM357 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM357 are further described hereinbelow with reference to Table 1.

[18211] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM357 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM357 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18212] As mentioned hereinabove with reference to Fig. 1, a function of VGAM357 gene, herein designated VGAM is inhibition of expression of VGAM357 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM357 correlate with, and may be deduced from, the identity of the target genes which VGAM357 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18213] AAT1 (Accession XM\_087415) is a VGAM357 host target gene. AAT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AAT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of AAT1 BINDING SITE, designated SEQ ID:39226, to the nucleotide sequence of VGAM357 RNA, herein designated VGAM RNA, also designated SEQ ID:3068.

[18214] A function of VGAM357 is therefore inhibition of AAT1 (Accession XM\_087415), a gene which linkage between A1BG and Lutheran blood group . Accordingly, utilities of VGAM357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AAT1. The function of AAT1 has been established by previous studies. The complete amino acid sequence of alpha-1B-glycoprotein, a plasma protein of unknown function, was determined by Ishioka et al. (1986). Sequence homology to immunoglobulins was recognized. Alpha-1B-glycoprotein is present in normal adult plasma at an average concentration of 22 mg/dl. Gahne et al. (1987) observed genetic polymorphism of A1B using one-dimensional horizontal polyacrylamide gel electrophoresis followed by Western blotting with specific antiserum. Three different phenotypes, designated 1-1, 1-2, and 2-2, were observed. Family data supported the hypothesis that the three phenotypes are determined by 2 codominant alleles at an autosomal locus. In pigs the homo-

gous locus is linked to malignant hyperthermia (OMIM Ref. No. 145600). Several other linkages in pigs and in horses suggest that human chromosomes 19, 6, and 1 are 'candidate chromosomes' for bearing the human A1B. Juneja et al. (1988) found a higher degree of A1B polymorphism in American blacks than in Caucasian populations. They described new alleles. Eiberg et al. (1989) reported exclusion data for localization of the alpha-1B-glycoprotein gene polymorphism. Eiberg et al. (1989) found linkage between A1BG and Lutheran blood group (OMIM Ref. No. 111150); lod = 3.06 at theta = 0.05 in males, and lod = 1.42 at theta = 0.10 in females. They suggested that the most likely order of genes on chromosome 19 is C3--SE--LU--A1BG.

[18215] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18216] Ishioka, N.; Takahashi, N.; Putnam, F. W. : Amino acid sequence of human plasma alpha-1B-glycoprotein: homology to the immunoglobulin supergene family. Proc. Nat. Acad. Sci. 83: 2363-2367, 1986. ; and

[18217] Eiberg, H.; Bisgaard, M. L.; Mohr, J. : Linkage between alpha-1-B-glycoprotein (A1BG) and Lutheran (LU) red blood

group system: assignment to chromosome 19: new genetic variants of A1BG.

[18218] Further studies establishing the function and utilities of AAT1 are found in John Hopkins OMIM database record ID 607086, and in cited publications numbered 5560–5561 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fatty-acid-Coenzyme A Ligase, Long-chain 5 (FACL5, Accession XM\_034424) is another VGAM357 host target gene. FACL5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FACL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FACL5 BINDING SITE, designated SEQ ID:32106, to the nucleotide sequence of VGAM357 RNA, herein designated VGAM RNA, also designated SEQ ID:3068.

[18219] Another function of VGAM357 is therefore inhibition of Fatty-acid-Coenzyme A Ligase, Long-chain 5 (FACL5, Accession XM\_034424), a gene which may be involved in fatty acid metabolism; contains an AMP-binding domain. Accordingly, utilities of VGAM357 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with FACL5. The function of FACL5 has been established by previous studies. Acyl-CoA synthetase (ACS; EC 6.2.1.3) catalyzes the formation of acyl-CoA from fatty acid, ATP, and CoA. This reaction is essential in mammalian fatty acid metabolism. In addition, ACS mediates the transportation of fatty acids into cells by cooperating with the fatty acid transporter protein (FATP; 600691). Oikawa et al. (1998) cloned rat Acs5 and found that it is highly expressed in proliferating 3T3-L1 cells. By screening a liver cDNA library with rat ACS5 as the probe, Yamashita et al. (2000) isolated a cDNA encoding human ACS5. The deduced 683-amino acid protein shares approximately 80% amino acid identity with the rat sequence. Northern blot analysis detected 2 major ACS5 transcripts of 2.5 and 3.7 kb in a wide range of tissues, with highest expression in uterus and spleen. Markedly increased levels of ACS5 transcripts were detected in a glioma line and in primary gliomas of grade IV malignancy, while ACS5 expression was found to be low in normal brain. Yamashita et al. (2000) found that cultured glioma cells infected with an adenovirus encoding ACS5 displayed induced cell growth on exposure to palmitate.

Consistent with the induction of cell growth, the virus-infected cells displayed induced uptake of palmitate. These results demonstrated a novel fatty acid-induced glioma cell growth mediated by ACS5.

[18220] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18221] Oikawa, E.; Iijima, H.; Suzuki, T.; Sasano, H.; Sato, H.; Kamataki, A.; Nagura, H.; Kang, M. J.; Fujino, T.; Suzuki, H.; Yamamoto, T. T. : A novel acyl-CoA synthetase, ACS5, expressed in intestinal epithelial cells and proliferating preadipocytes. J. Biochem. 124: 679–685, 1998. ; and

[18222] Yamashita, Y.; Kumabe, T.; Cho, Y.-Y.; Watanabe, M.; Kawagishi, J.; Yoshimoto, T.; Fujino, T.; Kang, M.-J.; Yamamoto, T. T. : Fatty acid induced glioma cell growth is mediated by the a.

[18223] Further studies establishing the function and utilities of FACL5 are found in John Hopkins OMIM database record ID 605677, and in cited publications numbered 968–969 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein Tyrosine Phosphatase, Receptor Type, C (PTPRC, Accession NM\_080921) is another VGAM357 host target gene. PT-

PTPRC BINDING SITE1 and PTPRC BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTPRC, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRC BINDING SITE1 and PTPRC BINDING SITE2, designated SEQ ID:28143 and SEQ ID:8717 respectively, to the nucleotide sequence of VGAM357 RNA, herein designated VGAM RNA, also designated SEQ ID:3068.

[18224] Another function of VGAM357 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, C (PTPRC, Accession NM\_080921). Accordingly, utilities of VGAM357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRC. Basic Leucine Zipper and W2 Domains 1 (BZW1, Accession NM\_014670) is another VGAM357 host target gene. BZW1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BZW1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BZW1 BINDING SITE, designated SEQ ID:16127, to the nu-

cleotide sequence of VGAM357 RNA, herein designated VGAM RNA, also designated SEQ ID:3068.

[18225] Another function of VGAM357 is therefore inhibition of Basic Leucine Zipper and W2 Domains 1 (BZW1, Accession NM\_014670). Accordingly, utilities of VGAM357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BZW1. Ectonucleotide Pyrophosphatase/phosphodiesterase 4 (putative function) (ENPP4, Accession NM\_014936) is another VGAM357 host target gene. ENPP4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ENPP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENPP4 BINDING SITE, designated SEQ ID:17238, to the nucleotide sequence of VGAM357 RNA, herein designated VGAM RNA, also designated SEQ ID:3068.

[18226] Another function of VGAM357 is therefore inhibition of Ectonucleotide Pyrophosphatase/phosphodiesterase 4 (putative function) (ENPP4, Accession NM\_014936). Accordingly, utilities of VGAM357 include diagnosis, prevention and treatment of diseases and clinical conditions as-

sociated with ENPP4. FLJ23056 (Accession NM\_024582) is another VGAM357 host target gene. FLJ23056 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23056, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23056 BINDING SITE, designated SEQ ID:23806, to the nucleotide sequence of VGAM357 RNA, herein designated VGAM RNA, also designated SEQ ID:3068.

[18227] Another function of VGAM357 is therefore inhibition of FLJ23056 (Accession NM\_024582). Accordingly, utilities of VGAM357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23056. NUCKS (Accession NM\_022731) is another VGAM357 host target gene. NUCKS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NUCKS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUCKS BINDING SITE, designated SEQ ID:22935, to the nucleotide sequence of VGAM357 RNA, herein designated VGAM RNA, also designated SEQ

ID:3068.

[18228] Another function of VGAM357 is therefore inhibition of NUCKS (Accession NM\_022731). Accordingly, utilities of VGAM357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUCKS. TSP-NY (Accession NM\_032573) is another VGAM357 host target gene. TSP-NY BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TSP-NY, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSP-NY BINDING SITE, designated SEQ ID:26302, to the nucleotide sequence of VGAM357 RNA, herein designated VGAM RNA, also designated SEQ ID:3068.

[18229] Another function of VGAM357 is therefore inhibition of TSP-NY (Accession NM\_032573). Accordingly, utilities of VGAM357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSP-NY. LOC151098 (Accession XM\_087096) is another VGAM357 host target gene. LOC151098 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151098, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151098 BINDING SITE, designated SEQ ID:39048, to the nucleotide sequence of VGAM357 RNA, herein designated VGAM RNA, also designated SEQ ID:3068.

[18230] Another function of VGAM357 is therefore inhibition of LOC151098 (Accession XM\_087096). Accordingly, utilities of VGAM357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151098. LOC151579 (Accession XM\_045290) is another VGAM357 host target gene. LOC151579 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151579, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151579 BINDING SITE, designated SEQ ID:34421, to the nucleotide sequence of VGAM357 RNA, herein designated VGAM RNA, also designated SEQ ID:3068.

[18231] Another function of VGAM357 is therefore inhibition of LOC151579 (Accession XM\_045290). Accordingly, utilities of VGAM357 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC151579. LOC158476 (Accession XM\_098955) is another VGAM357 host target gene. LOC158476 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158476, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158476 BINDING SITE, designated SEQ ID:41995, to the nucleotide sequence of VGAM357 RNA, herein designated VGAM RNA, also designated SEQ ID:3068.

[18232] Another function of VGAM357 is therefore inhibition of LOC158476 (Accession XM\_098955). Accordingly, utilities of VGAM357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158476. LOC200982 (Accession XM\_117305) is another VGAM357 host target gene. LOC200982 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200982, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200982 BINDING SITE, designated SEQ ID:43370, to

the nucleotide sequence of VGAM357 RNA, herein designated VGAM RNA, also designated SEQ ID:3068.

[18233] Another function of VGAM357 is therefore inhibition of LOC200982 (Accession XM\_117305). Accordingly, utilities of VGAM357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200982. LOC201516 (Accession XM\_113974) is another VGAM357 host target gene. LOC201516 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201516, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201516 BINDING SITE, designated SEQ ID:42581, to the nucleotide sequence of VGAM357 RNA, herein designated VGAM RNA, also designated SEQ ID:3068.

[18234] Another function of VGAM357 is therefore inhibition of LOC201516 (Accession XM\_113974). Accordingly, utilities of VGAM357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201516. LOC90593 (Accession XM\_032815) is another VGAM357 host target gene. LOC90593 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC90593, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90593 BINDING SITE, designated SEQ ID:31762, to the nucleotide sequence of VGAM357 RNA, herein designated VGAM RNA, also designated SEQ ID:3068.

[18235] Another function of VGAM357 is therefore inhibition of LOC90593 (Accession XM\_032815). Accordingly, utilities of VGAM357 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90593. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 358 (VGAM358) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18236] VGAM358 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM358 was detected is described hereinabove with reference to Figs. 1–8.

[18237] VGAM358 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Avian Infectious Bronchitis Virus. VGAM358 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18238] VGAM358 gene encodes a VGAM358 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM358 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM358 precursor RNA is designated SEQ ID:344, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:344 is located at position 10172 relative to the genome of Avian Infectious Bronchitis Virus.

[18239] VGAM358 precursor RNA folds onto itself, forming VGAM358 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18240] An enzyme complex designated DICER COMPLEX, `dices` the VGAM358 folded precursor RNA into VGAM358 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM358 RNA is designated SEQ ID:3069, and is provided hereinbelow with reference to the sequence listing part.

[18241] VGAM358 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM358 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM358 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18242] VGAM358 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM358 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM358 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM358 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM358 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18243] The complementary binding of VGAM358 RNA, herein designated VGAM RNA, to host target binding sites on VGAM358 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM358 host tar–

get RNA into VGAM358 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18244] It is appreciated that VGAM358 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM358 host target genes. The mRNA of each one of this plurality of VGAM358 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM358 RNA, herein designated VGAM RNA, and which when bound by VGAM358 RNA causes inhibition of translation of respective one or more VGAM358 host target proteins.

[18245] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM358 gene, herein designated VGAM GENE, on one or more VGAM358 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[18246] It is yet further appreciated that a function of VGAM358 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM358 include diagnosis, prevention and treatment of viral infection by Avian Infectious Bronchitis Virus. Specific functions, and accordingly utilities, of VGAM358 correlate with, and may be deduced from, the identity of the host target genes which VGAM358 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18247] Nucleotide sequences of the VGAM358 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM358 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM358 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM358 are further

described hereinbelow with reference to Table 1.

[18248] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM358 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM358 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18249] As mentioned hereinabove with reference to Fig. 1, a function of VGAM358 gene, herein designated VGAM is inhibition of expression of VGAM358 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM358 correlate with, and may be deduced from, the identity of the target genes which VGAM358 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18250] DKFZp547C176 (Accession XM\_040799) is a VGAM358 host target gene. DKFZp547C176 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp547C176, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DK-

FZp547C176 BINDING SITE, designated SEQ ID:33382, to the nucleotide sequence of VGAM358 RNA, herein designated VGAM RNA, also designated SEQ ID:3069.

[18251] A function of VGAM358 is therefore inhibition of DK-FZp547C176 (Accession XM\_040799). Accordingly, utilities of VGAM358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547C176. FLJ12806 (Accession NM\_022831) is another VGAM358 host target gene. FLJ12806 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12806, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12806 BINDING SITE, designated SEQ ID:23111, to the nucleotide sequence of VGAM358 RNA, herein designated VGAM RNA, also designated SEQ ID:3069.

[18252] Another function of VGAM358 is therefore inhibition of FLJ12806 (Accession NM\_022831). Accordingly, utilities of VGAM358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12806. LOC222160 (Accession XM\_168431) is another VGAM358 host target gene. LOC222160 BINDING SITE is HOST TAR-

GET binding site found in the 5' untranslated region of mRNA encoded by LOC222160, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222160 BINDING SITE, designated SEQ ID:45166, to the nucleotide sequence of VGAM358 RNA, herein designated VGAM RNA, also designated SEQ ID:3069.

[18253] Another function of VGAM358 is therefore inhibition of LOC222160 (Accession XM\_168431). Accordingly, utilities of VGAM358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222160. LOC51696 (Accession NM\_016217) is another VGAM358 host target gene. LOC51696 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51696, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51696 BINDING SITE, designated SEQ ID:18304, to the nucleotide sequence of VGAM358 RNA, herein designated VGAM RNA, also designated SEQ ID:3069.

[18254] Another function of VGAM358 is therefore inhibition of

LOC51696 (Accession NM\_016217). Accordingly, utilities of VGAM358 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51696. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 359 (VGAM359) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18255] VGAM359 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM359 was detected is described hereinabove with reference to Figs. 1–8.

[18256] VGAM359 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Infectious Bronchitis Virus. VGAM359 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18257] VGAM359 gene encodes a VGAM359 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM359 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM359 precursor RNA is designated SEQ ID:345, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:345 is located at position 9184 relative to the genome of Avian Infectious Bronchitis Virus.

[18258] VGAM359 precursor RNA folds onto itself, forming VGAM359 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18259] An enzyme complex designated DICER COMPLEX, `dices` the VGAM359 folded precursor RNA into VGAM359 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide se-

quence of VGAM359 RNA is designated SEQ ID:3070, and is provided hereinbelow with reference to the sequence listing part.

[18260] VGAM359 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM359 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM359 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[18261] VGAM359 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM359 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM359 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM359 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM359 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[18262] The complementary binding of VGAM359 RNA, herein designated VGAM RNA, to host target binding sites on VGAM359 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM359 host target RNA into VGAM359 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18263] It is appreciated that VGAM359 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM359 host target genes. The mRNA of each one of this plurality of VGAM359 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM359 RNA, herein designated VGAM RNA, and which when bound by VGAM359 RNA causes inhibition of translation of respective one or more VGAM359 host target proteins.

[18264] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM359 gene, herein designated VGAM GENE, on one or more VGAM359 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[18265] It is yet further appreciated that a function of VGAM359 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM359 include diagnosis, prevention and treatment of viral infection by Avian Infectious Bronchitis Virus. Specific functions, and accordingly utilities, of VGAM359 correlate with, and may be deduced from, the identity of the host target genes which VGAM359 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18266] Nucleotide sequences of the VGAM359 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM359 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM359 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM359 are further described hereinbelow with reference to Table 1.

[18267] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM359 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM359 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18268] As mentioned hereinabove with reference to Fig. 1, a function of VGAM359 gene, herein designated VGAM is inhibition of expression of VGAM359 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM359 correlate with, and may be deduced from, the identity of the target genes which VGAM359 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18269] Estrogen-related Receptor Gamma (ESRRG, Accession XM\_039053) is a VGAM359 host target gene. ESRRG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ESRRG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESRRG BINDING SITE, designated SEQ ID:32994, to the nucleotide sequence of VGAM359 RNA, herein designated VGAM RNA, also designated SEQ ID:3070.

[18270] A function of VGAM359 is therefore inhibition of Estrogen-related Receptor Gamma (ESRRG, Accession XM\_039053), a gene which Estrogen-related receptor gamma. Accordingly, utilities of VGAM359 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with ESRRG. The function of ESRRG has been established by previous studies. Members of the nuclear receptor superfamily are important regulators of development, cell proliferation, and physiology. During an analysis of the critical region of type IIa Usher syndrome (USH2A; 276901) at 1q41, Eudy et al. (1998) constructed a cDNA contig of ESRRG. Northern blot analysis detected a 5.5-kb ESRRG transcript in a variety of human adult and fetal tissues, with the highest level in fetal brain. The predicted 436-amino acid ESRRG protein, which is a member of the steroid/thyroid/retinoid receptor superfamily, is 76% identical to the orphan receptor ESRRB (OMIM Ref. No. 602167) and 63% identical to ESRRG (OMIM Ref. No. 601998). Heard et al. (2000) reported that the ESRRG mRNA is highly alternatively spliced at the 5-prime end, giving rise to a number of tissue-specific RNA species, some of which encode protein isoforms differing in the N-terminal region. Like ESRRG and ESRRB, ESRRG binds as a monomer to an ERR-alpha response element (ERRE). Hong et al. (1999) identified mouse *Esrrg*, which they called *Err3*, by yeast 2-hybrid screening using the transcriptional coactivator GRIP1 (OMIM Ref. No. 604597) as bait. The putative full-length mouse *Err3* contains 458 amino acids

and is closely related to Err1 and Err2. All ERR family members share an almost identical DNA-binding domain, which shares 68% amino acid identity with that of estrogen receptor. Expression of Err3 in adult mouse was restricted; highest expression was observed in heart, kidney, and brain. In mouse embryo, no expression was observed at day 7, and highest expression occurred around days 11 to 15. Although Err3 is more closely related to Err2 than to Err1, the expression pattern for Err3 was similar to that of Err1 and distinct from that for Err2, suggesting a unique role for Err3 in development. Eudy et al. (1998) mapped the ESRRG gene to the USH2A critical region on chromosome 1q41.

[18271] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18272] Heard, D. J.; Norby, P. L.; Holloway, J.; Vissing, H. : Human ERR-gamma, a third member of the estrogen receptor-related receptor (ERR) subfamily of orphan nuclear receptors: tissue-specific isoforms are expressed during development in the adult. *Molec. Endocr.* 14: 382-392, 2000. ; and

[18273] Eudy, J. D.; Yao, S.; Weston, M. D.; Ma-Edmonds, M.; Tal-

madge, C. B.; Cheng, J. J.; Kimberling, W. J.; Sumegi, J. : Isolation of a gene encoding a novel member of the nuclear receptor s.

[18274] Further studies establishing the function and utilities of ESRRG are found in John Hopkins OMIM database record ID 602969, and in cited publications numbered 8478–847 and 8539–8540 listed in the bibliography section herein–below, which are also hereby incorporated by reference. C1q and Tumor Necrosis Factor Related Protein 2 (C1QTNF2, Accession NM\_031908) is another VGAM359 host target gene. C1QTNF2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C1QTNF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1QTNF2 BINDING SITE, designated SEQ ID:25650, to the nucleotide sequence of VGAM359 RNA, herein designated VGAM RNA, also designated SEQ ID:3070.

[18275] Another function of VGAM359 is therefore inhibition of C1q and Tumor Necrosis Factor Related Protein 2 (C1QTNF2, Accession NM\_031908). Accordingly, utilities of VGAM359 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with C1QTNF2. FLJ32865 (Accession NM\_144613) is another VGAM359 host target gene. FLJ32865 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ32865, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32865 BINDING SITE, designated SEQ ID:29423, to the nucleotide sequence of VGAM359 RNA, herein designated VGAM RNA, also designated SEQ ID:3070.

[18276] Another function of VGAM359 is therefore inhibition of FLJ32865 (Accession NM\_144613). Accordingly, utilities of VGAM359 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32865. Junctional Adhesion Molecule 1 (JAM1, Accession NM\_144502) is another VGAM359 host target gene. JAM1 BINDING SITE1 through JAM1 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by JAM1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JAM1 BINDING SITE1

through JAM1 BINDING SITE4, designated SEQ ID:29324, SEQ ID:29344, SEQ ID:29333 and SEQ ID:18857 respectively, to the nucleotide sequence of VGAM359 RNA, herein designated VGAM RNA, also designated SEQ ID:3070.

[18277] Another function of VGAM359 is therefore inhibition of Junctional Adhesion Molecule 1 (JAM1, Accession NM\_144502). Accordingly, utilities of VGAM359 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JAM1. LOC201627 (Accession XM\_114353) is another VGAM359 host target gene. LOC201627 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201627, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201627 BINDING SITE, designated SEQ ID:42896, to the nucleotide sequence of VGAM359 RNA, herein designated VGAM RNA, also designated SEQ ID:3070.

[18278] Another function of VGAM359 is therefore inhibition of LOC201627 (Accession XM\_114353). Accordingly, utilities of VGAM359 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC201627. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 360 (VGAM360) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18279] VGAM360 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM360 was detected is described hereinabove with reference to Figs. 1–8.

[18280] VGAM360 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Infectious Bronchitis Virus. VGAM360 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18281] VGAM360 gene encodes a VGAM360 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM360 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM360 precursor RNA is designated SEQ

ID:346, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:346 is located at position 11848 relative to the genome of Avian Infectious Bronchitis Virus.

[18282] VGAM360 precursor RNA folds onto itself, forming VGAM360 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18283] An enzyme complex designated DICER COMPLEX, `dices` the VGAM360 folded precursor RNA into VGAM360 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM360 RNA is designated SEQ ID:3071, and is provided hereinbelow with reference to the sequence

listing part.

[18284] VGAM360 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM360 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM360 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18285] VGAM360 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM360 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM360 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM360 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM360 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18286] The complementary binding of VGAM360 RNA, herein designated VGAM RNA, to host target binding sites on VGAM360 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM360 host target RNA into VGAM360 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18287] It is appreciated that VGAM360 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM360 host target genes. The mRNA of each one of this plurality of VGAM360 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM360 RNA, herein designated VGAM

RNA, and which when bound by VGAM360 RNA causes inhibition of translation of respective one or more VGAM360 host target proteins.

[18288] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM360 gene, herein designated VGAM GENE, on one or more VGAM360 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[18289] It is yet further appreciated that a function of VGAM360 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM360 include diagnosis, prevention and treatment of viral infection by Avian Infectious Bronchitis Virus. Specific functions, and accordingly utilities, of VGAM360 correlate with, and may be deduced from, the identity of the host target genes which VGAM360 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18290] Nucleotide sequences of the VGAM360 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM360 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM360 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM360 are further described hereinbelow with reference to Table 1.

[18291] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM360 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM360 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18292] As mentioned hereinabove with reference to Fig. 1, a function of VGAM360 gene, herein designated VGAM is

inhibition of expression of VGAM360 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM360 correlate with, and may be deduced from, the identity of the target genes which VGAM360 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18293] Neuronal Cell Adhesion Molecule (NRCAM, Accession NM\_005010) is a VGAM360 host target gene. NRCAM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NRCAM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRCAM BINDING SITE, designated SEQ ID:11447, to the nucleotide sequence of VGAM360 RNA, herein designated VGAM RNA, also designated SEQ ID:3071.

[18294] A function of VGAM360 is therefore inhibition of Neuronal Cell Adhesion Molecule (NRCAM, Accession NM\_005010), a gene which functions as a cell surface protein and belongs to the immunoglobulin superfamily. Accordingly, utilities of VGAM360 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRCAM. The function of NRCAM and its association

with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM268.UPF3A (Accession NM\_023011) is another VGAM360 host target gene. UPF3A BINDING SITE1 and UPF3A BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by UPF3A, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UPF3A BINDING SITE1 and UPF3A BINDING SITE2, designated SEQ ID:23276 and SEQ ID:27987 respectively, to the nucleotide sequence of VGAM360 RNA, herein designated VGAM RNA, also designated SEQ ID:3071.

[18295] Another function of VGAM360 is therefore inhibition of UPF3A (Accession NM\_023011), a gene which facilitates the export of spliced mRNAs by recruiting mRNA export proteins. Accordingly, utilities of VGAM360 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UPF3A. The function of UPF3A has been established by previous studies. Using comparative genomics and RACE, Serin et al. (2001) isolated cDNAs encoding UPF3A, which they called UPF3, and UPF3B,

which they called UPF3X. UPF3A encodes a 452–amino acid protein and a 420–amino acid splice variant. Northern blot analysis revealed expression of 2.1– and 2.4–kb UPF3A transcripts in HeLa cells. By immunoprecipitation and immunoblot analyses of nucleoplasmic fractions, Kim et al. (2001) showed that UPF3A and UPF3B are associated in an RNase–resistant manner with Y14 (RBM8A; 605313), as well as with the mRNA export factors ALY (OMIM Ref. No. 604171) and TAP (NXF1; 602647), in mRNA–protein complexes. UPF3 proteins appeared to bind immediately upstream of exon–exon junctions. Kim et al. (2001) concluded that UPF3 proteins facilitate the export of spliced mRNAs by recruiting mRNA export proteins. They proposed that UPF3 functions in NMD and travels with the mRNA to the cytoplasm, where a leading translating ribosome displaces the UPF3–Y14 complexes from the mRNA.

[18296] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18297] Serin, G.; Gersappe, A.; Black, J. D.; Aronoff, R.; Maquat, L. E. : Identification and characterization of human orthologues to *Saccharomyces cerevisiae* Upf2 protein and Upf3 protein (*Caenorhabditis elegans* SMG–4). *Molec. Cell. Biol.*

21: 209–223, 2001. ; and

[18298] Kim, V. N.; Kataoka, N.; Dreyfuss, G. : Role of the non-sense-mediated decay factor hUpf3 in the splicing-dependent exon-exon junction complex. Science 293: 1832–1836, 2001.

[18299] Further studies establishing the function and utilities of UPF3A are found in John Hopkins OMIM database record ID 605530, and in cited publications numbered 9142–9145 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. LOC163882 (Accession XM\_089211) is another VGAM360 host target gene. LOC163882 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC163882, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163882 BINDING SITE, designated SEQ ID:39969, to the nucleotide sequence of VGAM360 RNA, herein designated VGAM RNA, also designated SEQ ID:3071.

[18300] Another function of VGAM360 is therefore inhibition of LOC163882 (Accession XM\_089211). Accordingly, utilities of VGAM360 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC163882. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 361 (VGAM361) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18301] VGAM361 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM361 was detected is described hereinabove with reference to Figs. 1–8.

[18302] VGAM361 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Infectious Bronchitis Virus. VGAM361 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18303] VGAM361 gene encodes a VGAM361 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM361 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM361 precursor RNA is designated SEQ

ID:347, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:347 is located at position 6715 relative to the genome of Avian Infectious Bronchitis Virus.

[18304] VGAM361 precursor RNA folds onto itself, forming VGAM361 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18305] An enzyme complex designated DICER COMPLEX, `dices` the VGAM361 folded precursor RNA into VGAM361 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM361 RNA is designated SEQ ID:3072, and is provided hereinbelow with reference to the sequence

listing part.

[18306] VGAM361 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM361 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM361 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18307] VGAM361 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM361 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM361 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM361 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM361 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18308] The complementary binding of VGAM361 RNA, herein designated VGAM RNA, to host target binding sites on VGAM361 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM361 host target RNA into VGAM361 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18309] It is appreciated that VGAM361 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM361 host target genes. The mRNA of each one of this plurality of VGAM361 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM361 RNA, herein designated VGAM

RNA, and which when bound by VGAM361 RNA causes inhibition of translation of respective one or more VGAM361 host target proteins.

[18310] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM361 gene, herein designated VGAM GENE, on one or more VGAM361 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[18311] It is yet further appreciated that a function of VGAM361 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM361 include diagnosis, prevention and treatment of viral infection by Avian Infectious Bronchitis Virus. Specific functions, and accordingly utilities, of VGAM361 correlate with, and may be deduced from, the identity of the host target genes which VGAM361 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18312] Nucleotide sequences of the VGAM361 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM361 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM361 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM361 are further described hereinbelow with reference to Table 1.

[18313] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM361 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM361 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18314] As mentioned hereinabove with reference to Fig. 1, a function of VGAM361 gene, herein designated VGAM is

inhibition of expression of VGAM361 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM361 correlate with, and may be deduced from, the identity of the target genes which VGAM361 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18315] LOC149465 (Accession XM\_086543) is a VGAM361 host target gene. LOC149465 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149465 BINDING SITE, designated SEQ ID:38759, to the nucleotide sequence of VGAM361 RNA, herein designated VGAM RNA, also designated SEQ ID:3072.

[18316] A function of VGAM361 is therefore inhibition of LOC149465 (Accession XM\_086543). Accordingly, utilities of VGAM361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149465. LOC90591 (Accession XM\_032811) is another VGAM361 host target gene. LOC90591 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC90591, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90591 BINDING SITE, designated SEQ ID:31758, to the nucleotide sequence of VGAM361 RNA, herein designated VGAM RNA, also designated SEQ ID:3072.

[18317] Another function of VGAM361 is therefore inhibition of LOC90591 (Accession XM\_032811). Accordingly, utilities of VGAM361 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90591. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 362 (VGAM362) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18318] VGAM362 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM362 was detected is described hereinabove with reference to Figs. 1–8.

[18319] VGAM362 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Avian Infectious Bronchitis Virus. VGAM362 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18320] VGAM362 gene encodes a VGAM362 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM362 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM362 precursor RNA is designated SEQ ID:348, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:348 is located at position 4697 relative to the genome of Avian Infectious Bronchitis Virus.

[18321] VGAM362 precursor RNA folds onto itself, forming VGAM362 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18322] An enzyme complex designated DICER COMPLEX, `dices` the VGAM362 folded precursor RNA into VGAM362 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM362 RNA is designated SEQ ID:3073, and is provided hereinbelow with reference to the sequence listing part.

[18323] VGAM362 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM362 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM362 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18324] VGAM362 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM362 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM362 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM362 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM362 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[18325] The complementary binding of VGAM362 RNA, herein designated VGAM RNA, to host target binding sites on VGAM362 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM362 host tar-

get RNA into VGAM362 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18326] It is appreciated that VGAM362 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM362 host target genes. The mRNA of each one of this plurality of VGAM362 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM362 RNA, herein designated VGAM RNA, and which when bound by VGAM362 RNA causes inhibition of translation of respective one or more VGAM362 host target proteins.

[18327] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM362 gene, herein designated VGAM GENE, on one or more VGAM362 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[18328] It is yet further appreciated that a function of VGAM362 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM362 include diagnosis, prevention and treatment of viral infection by Avian Infectious Bronchitis Virus. Specific functions, and accordingly utilities, of VGAM362 correlate with, and may be deduced from, the identity of the host target genes which VGAM362 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18329] Nucleotide sequences of the VGAM362 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM362 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM362 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM362 are further

described hereinbelow with reference to Table 1.

[18330] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM362 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM362 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18331] As mentioned hereinabove with reference to Fig. 1, a function of VGAM362 gene, herein designated VGAM is inhibition of expression of VGAM362 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM362 correlate with, and may be deduced from, the identity of the target genes which VGAM362 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18332] GNE (Accession NM\_005476) is a VGAM362 host target gene. GNE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GNE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNE BINDING SITE, designated SEQ ID:11976,

to the nucleotide sequence of VGAM362 RNA, herein designated VGAM RNA, also designated SEQ ID:3073.

[18333] A function of VGAM362 is therefore inhibition of GNE (Accession NM\_005476), a gene which has roles in sialic acid biosynthesis and regulates cell surface sialylation. Accordingly, utilities of VGAM362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNE. The function of GNE has been established by previous studies. Keppler et al. (1999) determined that UDP-GlcNAc 2-epimerase activity is rate-limiting for the biosynthesis of sialic acid and is required for sialylation in hematopoietic cells. The activity of the enzyme can be controlled at the transcriptional level and can affect the sialylation and function of specific cell surface molecules expressed on B cells and myeloid cells. In a Genbank submission (AJ238764), these authors reported the sequence of a human UDP-GlcNAc 2-epimerase cDNA. Animal model experiments lend further support to the function of GNE. Schwarzkopf et al. (2002) reported that inactivation of GNE (which is bifunctional and is the key enzyme of sialic acid biosynthesis) by gene targeting in mice caused early embryonic lethality, thereby emphasizing the fundamental role of the enzyme and sialylation

during development. The need of the enzyme for a defined sialylation process is exemplified by the polysialylation of the neural cell adhesion molecule in embryonic stem cells.

[18334] It is appreciated that the abovementioned animal model for GNE is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[18335] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18336] Keppler, O. T.; Hinderlich, S.; Langner, J.; Schwartz-Albiez, R.; Reutter, W.; Pawlita, M. : UDP-GlcNAc 2-epimerase: a regulator of cell surface sialylation. Science 284: 1372-1376, 1999. ; and

[18337] Schwarzkopf, M.; Knobloch, K.-P.; Rohde, E.; Hinderlich, S.; Wiechens, N.; Lucka, L.; Horak, I.; Reutter, W.; Horstkoorte, R. : Sialylation is essential for early development in mice.

[18338] Further studies establishing the function and utilities of GNE are found in John Hopkins OMIM database record ID 603824, and in cited publications numbered 7516-5179, 7929-5181, 1662-1663, 5167-5168, 1664, 5182, 1139

and 11407 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Membrane-spanning 4-domains, Subfamily A, Member 1 (MS4A1, Accession NM\_000139) is another VGAM362 host target gene. MS4A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MS4A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MS4A1 BINDING SITE, designated SEQ ID:5631, to the nucleotide sequence of VGAM362 RNA, herein designated VGAM RNA, also designated SEQ ID:3073.

[18339] Another function of VGAM362 is therefore inhibition of Membrane-spanning 4-domains, Subfamily A, Member 1 (MS4A1, Accession NM\_000139), a gene which may be involved in the regulation of b-cell activation and proliferation. Accordingly, utilities of VGAM362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MS4A1. The function of MS4A1 has been established by previous studies. B1, also known as CD20 or MS4A1, is a human B-lymphocyte surface molecule that is widely expressed during B-cell ontogeny,

from early pre-B-cell developmental stages until final differentiation into plasma cells. Functional studies using monoclonal antibodies have shown that antibody binding to B1 inhibits B-cell proliferation caused by mitogens and inhibits B-cell differentiation. Tedder et al. (1988) described the primary structure of CD20. Tedder et al. (1989) showed that the CD20 gene is 16 kb long and contains 8 exons. Using in situ hybridization and Southern blotting of hybrid cell DNA, Tedder et al. (1989) showed that the CD20 gene is located on 11q12-q13. This localization places the CD20 gene near the site of the t(11;14)(q13;q32) translocation that is found in a subgroup of B-cell malignancies; see 151400. The CD20 gene was found to lie on the centromeric side of BCL1 (OMIM Ref. No. 168461) and to be separated from BCL1 by at least 50 kb of DNA. The proximal location of CD20 was indicated by the fact that it is not translocated to chromosome 14 in the translocation. It must be located between the centromere of chromosome 11 and the 3-prime end of BCL1. Szepetowski et al. (1993) studied amplification of the BCL1 region in breast cancer to map genes in the 11q13 band. CD20 was the most proximal of 13 genes located centromeric to BCL1 and was in the same group as

CD5, PGA4 (OMIM Ref. No. 169720), and FTH1 (OMIM Ref. No. 134770). Distal to this cluster was a group of 3 genes, COX8 (OMIM Ref. No. 123870), PYGM (OMIM Ref. No. 232600), and SEA (OMIM Ref. No. 165110), of which the most proximal was COX8.

[18340] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18341] Szepetowski, P.; Perucca-Lostanlen, D.; Gaudray, P. : Mapping genes according to their amplification status in tumor cells: contribution to the map of 11q13. Genomics 16: 745–750, 1993. ; and

[18342] Tedder, T. F.; Klejman, G.; Schlossman, S. F.; Saito, H. : Structure of the gene encoding the human B lymphocyte differentiation antigen CD20 (B1). J. Immun. 142: 2560–2568, 1989.

[18343] Further studies establishing the function and utilities of MS4A1 are found in John Hopkins OMIM database record ID 112210, and in cited publications numbered 455 and 4552–4554 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Tissue Inhibitor of Metalloproteinase 3 (Sorsby fundus dystrophy, pseudoinflammatory) (TIMP3, Accession NM\_000362) is

another VGAM362 host target gene. TIMP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIMP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIMP3 BINDING SITE, designated SEQ ID:5935, to the nucleotide sequence of VGAM362 RNA, herein designated VGAM RNA, also designated SEQ ID:3073.

[18344] Another function of VGAM362 is therefore inhibition of Tissue Inhibitor of Metalloproteinase 3 (Sorsby fundus dystrophy, pseudoinflammatory) (TIMP3, Accession NM\_000362). Accordingly, utilities of VGAM362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIMP3. Transient Receptor Potential Cation Channel, Subfamily C, Member 5 (TRPC5, Accession NM\_012471) is another VGAM362 host target gene. TRPC5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPC5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPC5 BINDING SITE, designated SEQ

ID:14851, to the nucleotide sequence of VGAM362 RNA, herein designated VGAM RNA, also designated SEQ ID:3073.

[18345] Another function of VGAM362 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily C, Member 5 (TRPC5, Accession NM\_012471). Accordingly, utilities of VGAM362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPC5. FLJ10511 (Accession NM\_018120) is another VGAM362 host target gene. FLJ10511 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ10511, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10511 BINDING SITE, designated SEQ ID:19900, to the nucleotide sequence of VGAM362 RNA, herein designated VGAM RNA, also designated SEQ ID:3073.

[18346] Another function of VGAM362 is therefore inhibition of FLJ10511 (Accession NM\_018120). Accordingly, utilities of VGAM362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10511. IL-17RE (Accession NM\_144640) is another VGAM362

host target gene. IL-17RE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL-17RE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL-17RE BINDING SITE, designated SEQ ID:29465, to the nucleotide sequence of VGAM362 RNA, herein designated VGAM RNA, also designated SEQ ID:3073.

[18347] Another function of VGAM362 is therefore inhibition of IL-17RE (Accession NM\_144640). Accordingly, utilities of VGAM362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL-17RE. LOC150848 (Accession XM\_097959) is another VGAM362 host target gene. LOC150848 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150848, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150848 BINDING SITE, designated SEQ ID:41258, to the nucleotide sequence of VGAM362 RNA, herein designated VGAM RNA, also designated SEQ ID:3073.

[18348] Another function of VGAM362 is therefore inhibition of LOC150848 (Accession XM\_097959). Accordingly, utilities of VGAM362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150848. LOC253868 (Accession XM\_170975) is another VGAM362 host target gene. LOC253868 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253868, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253868 BINDING SITE, designated SEQ ID:45746, to the nucleotide sequence of VGAM362 RNA, herein designated VGAM RNA, also designated SEQ ID:3073.

[18349] Another function of VGAM362 is therefore inhibition of LOC253868 (Accession XM\_170975). Accordingly, utilities of VGAM362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253868. LOC257465 (Accession XM\_088384) is another VGAM362 host target gene. LOC257465 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257465, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257465 BINDING SITE, designated SEQ ID:39667, to the nucleotide sequence of VGAM362 RNA, herein designated VGAM RNA, also designated SEQ ID:3073.

[18350] Another function of VGAM362 is therefore inhibition of LOC257465 (Accession XM\_088384). Accordingly, utilities of VGAM362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257465. LOC93206 (Accession XM\_049838) is another VGAM362 host target gene. LOC93206 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC93206, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93206 BINDING SITE, designated SEQ ID:35519, to the nucleotide sequence of VGAM362 RNA, herein designated VGAM RNA, also designated SEQ ID:3073.

[18351] Another function of VGAM362 is therefore inhibition of LOC93206 (Accession XM\_049838). Accordingly, utilities of VGAM362 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC93206. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 363 (VGAM363) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18352] VGAM363 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM363 was detected is described hereinabove with reference to Figs. 1–8.

[18353] VGAM363 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Infectious Bronchitis Virus. VGAM363 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18354] VGAM363 gene encodes a VGAM363 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM363 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM363 precursor RNA is designated SEQ ID:349, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:349 is located at position 5806 relative to the genome of Avian Infectious Bronchitis Virus.

[18355] VGAM363 precursor RNA folds onto itself, forming VGAM363 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18356] An enzyme complex designated DICER COMPLEX, `dices` the VGAM363 folded precursor RNA into VGAM363 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM363 RNA is designated SEQ ID:3074, and is provided hereinbelow with reference to the sequence listing part.

[18357] VGAM363 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM363 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM363 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18358] VGAM363 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM363 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM363 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM363 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM363 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18359] The complementary binding of VGAM363 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM363 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM363 host target RNA into VGAM363 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18360] It is appreciated that VGAM363 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM363 host target genes. The mRNA of each one of this plurality of VGAM363 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM363 RNA, herein designated VGAM RNA, and which when bound by VGAM363 RNA causes inhibition of translation of respective one or more VGAM363 host target proteins.

[18361] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM363 gene, herein designated VGAM GENE, on one or more VGAM363 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[18362] It is yet further appreciated that a function of VGAM363 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of viral infection by Avian Infectious Bronchitis Virus. Specific functions, and accordingly utilities, of VGAM363 correlate with, and may be deduced from, the identity of the host target genes which VGAM363 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18363] Nucleotide sequences of the VGAM363 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

5' duced 5' VGAM363 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM363 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM363 are further described hereinbelow with reference to Table 1.

[18364] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM363 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM363 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18365] As mentioned hereinabove with reference to Fig. 1, a function of VGAM363 gene, herein designated VGAM is inhibition of expression of VGAM363 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM363 correlate with, and may be deduced from, the identity of the target genes which VGAM363 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18366] EGF-like-domain, Multiple 5 (EGFL5, Accession XM\_098838) is a VGAM363 host target gene. EGFL5 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by EGFL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGFL5 BINDING SITE, designated SEQ ID:41874, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:3074.

[18367] A function of VGAM363 is therefore inhibition of EGF-like-domain, Multiple 5 (EGFL5, Accession XM\_098838). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFL5. Outer Dense Fiber of Sperm Tails 2 (ODF2, Accession NM\_002540) is another VGAM363 host target gene. ODF2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ODF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ODF2 BINDING SITE, designated SEQ ID:8384, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:3074.

[18368] Another function of VGAM363 is therefore inhibition of

Outer Dense Fiber of Sperm Tails 2 (ODF2, Accession NM\_002540), a gene which is very strongly similar to rat Odf2 . Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ODF2. The function of ODF2 has been established by previous studies. See ODF1 (OMIM Ref. No. 182878). Brohmann et al. (1997) used antibodies against Odf proteins to screen a rat testis expression library and isolated the rat Odf2 gene. Sequence analysis revealed that the protein has an overall alpha-helical structure with 2 regions identical to the dimerization region of a leucine zipper motif. Brohmann et al. (1997) documented Odf2 cDNAs with 3 different 5-prime end sequences, presumed to be the result of alternative splicing. They found expression of the rat gene only in testis. The EST database contains several human cDNA sequences which are closely related to rat Odf2, suggesting that a human homolog exists (Scott, 1997). These human cDNA sequences were derived from testis, epididymis, and fetal brain libraries. Shao et al. (1997) used a yeast 2-hybrid screening with the leucine zipper region of ODF1 (ODF27; Shao and van der Hoorn, 1996) as bait to isolate rat testis-specific proteins that could interact with ODF27.

They demonstrated that one of the novel genes isolated encoded the 84-kD ODF protein ODF2.

[18369] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18370] Brohmann, H.; Pinnecke, S.; Hoyer-Fender, S. : Identification and characterization of new cDNAs encoding outer dense fiber proteins of rat sperm. J. Biol. Chem. 272: 10327–10332, 1997. ; and

[18371] Shao, X.; Tarnasky, H. A.; Schalles, U.; Oko, R.; van der Hoorn, F. A. : Interactional cloning of the 84-kDa major outer dense fiber protein Odf84: leucine zippers mediate associations.

[18372] Further studies establishing the function and utilities of ODF2 are found in John Hopkins OMIM database record ID 602015, and in cited publications numbered 5928–593 and 5706–5707 listed in the bibliography section herein–below, which are also hereby incorporated by reference. Testis Derived Transcript (3 LIM domains) (TES, Accession XM\_050430) is another VGAM363 host target gene. TES BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TES, corresponding to a HOST TARGET binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TES BINDING SITE, designated SEQ ID:35631, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:3074.

[18373] Another function of VGAM363 is therefore inhibition of Testis Derived Transcript (3 LIM domains) (TES, Accession XM\_050430), a gene which acts as a tumor suppressor. Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TES. The function of TES has been established by previous studies. By construction and sequencing of a BAC contig within the FRA7G region at 7q31.2, Tatarelli et al. (2000) identified a novel gene which they called TESTIN because of its homology to mouse testin. They isolated 3 human isoforms. Isoforms 1 and 2, which use exon 1a and differ in their 3-prime UTR, contain 7 exons and encode a deduced 421-amino acid protein with a calculated molecular mass of 48 kD. Isoform 3, which uses exon 1b, encodes a deduced 412-amino acid protein with a calculated molecular mass of 47 kD. Each of the isoforms contains 3 LIM domains in the C terminus and shows 89% and 35% sequence identity with the mouse and

C. elegans homologs, respectively. Human TESTIN contains 7 putative functional sites: 4 phosphorylation sites, a glycosylation site, a myristylation site, and a cytochrome C heme-binding site. Northern blot analysis of normal human tissues demonstrated ubiquitous expression of an approximately 2.8-kb TESTIN transcript, which apparently corresponded to isoforms 2 and 3. An approximately 1.5-kb transcript, corresponding to isoform 1, was expressed at significantly higher levels in testis than in other tissues. FRA7G is a common aphidicolin-inducible fragile site at 7q31.2 showing loss of heterozygosity in human malignancies. Tatarelli et al. (2000) noted that a relationship between LIM proteins and cancer had been observed in several studies. By RT-PCR analysis, they found lack of TESTIN expression in 22% of cancer cell lines and 44% of the cell lines derived from hematologic malignancies. They determined that in most of these cases the inactivation of TESTIN expression was due to methylation of a CpG island. Analysis of the TESTIN coding region in 26 tumor cell lines revealed 3 missense mutations. The authors thus suggested that TESTIN may represent a tumor suppressor gene. Tobias et al. (2001) also cloned and characterized human TESTIN, which they called TES. Mutation

analysis of the coding TES exons in 21 human-derived cell lines revealed the presence of a frameshift mutation in 1 allele in a breast cancer cell line. Methylation of the CpG island at the 5-prime end of TES appeared to be a remarkably frequent finding, occurring in 7 of 10 ovarian carcinomas and in each of 30 tumor-derived cell lines tested. Moreover, forced expression of TES in HeLa or OV-CAR5 cells resulted in a profound reduction in growth potential, as determined by the colony formation assay. Tobias et al. (2001) suggested that TES is a tumor suppressor gene that is inactivated primarily by transcriptional silencing resulting from CpG island methylation.

[18374] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18375] Tatarelli, C.; Linnenbach, A.; Mimori, K.; Croce, C. M. : Characterization of the human TESTIN gene localized in the FRA7G region at 7q31.2. Genomics 68: 1-12, 2000. ; and

[18376] Tobias, E. S.; Hurlstone, A. F. L.; MacKenzie, E.; McFarlane, R.; Black, D. M. : The TES gene at 7q31.1 is methylated in tumours and encodes a novel growth-suppressing LIM domain prote.

[18377] Further studies establishing the function and utilities of TES are found in John Hopkins OMIM database record ID 606085, and in cited publications numbered 6120–6121 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Tropomodulin 3 (ubiquitous) (TMOD3, Accession NM\_014547) is another VGAM363 host target gene. TMOD3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TMOD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TMOD3 BINDING SITE, designated SEQ ID:15857, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:3074.

[18378] Another function of VGAM363 is therefore inhibition of Tropomodulin 3 (ubiquitous) (TMOD3, Accession NM\_014547). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMOD3. CNIL (Accession NM\_005776) is another VGAM363 host target gene. CNIL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNIL, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNIL BINDING SITE, designated SEQ ID:12355, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:3074.

[18379] Another function of VGAM363 is therefore inhibition of CNIL (Accession NM\_005776). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNIL. DKFZP564I0422 (Accession NM\_031435) is another VGAM363 host target gene. DKFZP564I0422 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564I0422, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564I0422 BINDING SITE, designated SEQ ID:25431, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:3074.

[18380] Another function of VGAM363 is therefore inhibition of DKFZP564I0422 (Accession NM\_031435). Accordingly, utilities of VGAM363 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with DKFZP564I0422. HT014 (Accession NM\_020362) is another VGAM363 host target gene. HT014 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HT014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HT014 BINDING SITE, designated SEQ ID:21634, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:3074.

[18381] Another function of VGAM363 is therefore inhibition of HT014 (Accession NM\_020362). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HT014. KIAA0193 (Accession NM\_014766) is another VGAM363 host target gene. KIAA0193 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0193 BINDING SITE, designated SEQ ID:16540, to the nucleotide sequence of

VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:3074.

[18382] Another function of VGAM363 is therefore inhibition of KIAA0193 (Accession NM\_014766). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0193. KIAA0276 (Accession XM\_048199) is another VGAM363 host target gene. KIAA0276 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0276 BINDING SITE, designated SEQ ID:35135, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:3074.

[18383] Another function of VGAM363 is therefore inhibition of KIAA0276 (Accession XM\_048199). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0276. LOC115073 (Accession XM\_055193) is another VGAM363 host target gene. LOC115073 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by LOC115073, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115073 BINDING SITE, designated SEQ ID:36237, to the nucleotide sequence of VGAM363 RNA, herein designated VGAM RNA, also designated SEQ ID:3074.

[18384] Another function of VGAM363 is therefore inhibition of LOC115073 (Accession XM\_055193). Accordingly, utilities of VGAM363 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115073. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 364 (VGAM364) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18385] VGAM364 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM364 was detected is described hereinabove with reference to Figs. 1–8.

[18386] VGAM364 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Avian Infectious Bronchitis Virus. VGAM364 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18387] VGAM364 gene encodes a VGAM364 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM364 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM364 precursor RNA is designated SEQ ID:350, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:350 is located at position 10866 relative to the genome of Avian Infectious Bronchitis Virus.

[18388] VGAM364 precursor RNA folds onto itself, forming VGAM364 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18389] An enzyme complex designated DICER COMPLEX, `dices` the VGAM364 folded precursor RNA into VGAM364 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM364 RNA is designated SEQ ID:3075, and is provided hereinbelow with reference to the sequence listing part.

[18390] VGAM364 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM364 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM364 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18391] VGAM364 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM364 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM364 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM364 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM364 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18392] The complementary binding of VGAM364 RNA, herein designated VGAM RNA, to host target binding sites on VGAM364 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM364 host tar-

get RNA into VGAM364 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18393] It is appreciated that VGAM364 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM364 host target genes. The mRNA of each one of this plurality of VGAM364 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM364 RNA, herein designated VGAM RNA, and which when bound by VGAM364 RNA causes inhibition of translation of respective one or more VGAM364 host target proteins.

[18394] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM364 gene, herein designated VGAM GENE, on one or more VGAM364 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[18395] It is yet further appreciated that a function of VGAM364 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM364 include diagnosis, prevention and treatment of viral infection by Avian Infectious Bronchitis Virus. Specific functions, and accordingly utilities, of VGAM364 correlate with, and may be deduced from, the identity of the host target genes which VGAM364 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18396] Nucleotide sequences of the VGAM364 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM364 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM364 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM364 are further

described hereinbelow with reference to Table 1.

[18397] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM364 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM364 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18398] As mentioned hereinabove with reference to Fig. 1, a function of VGAM364 gene, herein designated VGAM is inhibition of expression of VGAM364 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM364 correlate with, and may be deduced from, the identity of the target genes which VGAM364 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18399] PSR (Accession XM\_036784) is a VGAM364 host target gene. PSR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PSR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSR BINDING SITE, designated SEQ ID:32503,

to the nucleotide sequence of VGAM364 RNA, herein designated VGAM RNA, also designated SEQ ID:3075.

[18400] A function of VGAM364 is therefore inhibition of PSR (Accession XM\_036784). Accordingly, utilities of VGAM364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSR. Retinoic Acid Induced 17 (RAI17, Accession XM\_166091) is another VGAM364 host target gene. RAI17 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAI17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAI17 BINDING SITE, designated SEQ ID:43859, to the nucleotide sequence of VGAM364 RNA, herein designated VGAM RNA, also designated SEQ ID:3075.

[18401] Another function of VGAM364 is therefore inhibition of Retinoic Acid Induced 17 (RAI17, Accession XM\_166091). Accordingly, utilities of VGAM364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAI17. SEC24 Related Gene Family, Member A (*S. cerevisiae*) (SEC24A, Accession XM\_094581) is another VGAM364 host target gene. SEC24A BINDING SITE

is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SEC24A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC24A BINDING SITE, designated SEQ ID:40233, to the nucleotide sequence of VGAM364 RNA, herein designated VGAM RNA, also designated SEQ ID:3075.

[18402] Another function of VGAM364 is therefore inhibition of SEC24 Related Gene Family, Member A (*S. cerevisiae*) (SEC24A, Accession XM\_094581). Accordingly, utilities of VGAM364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC24A. LOC255565 (Accession XM\_170811) is another VGAM364 host target gene. LOC255565 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255565, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255565 BINDING SITE, designated SEQ ID:45589, to the nucleotide sequence of VGAM364 RNA, herein designated VGAM RNA, also designated SEQ ID:3075.

[18403] Another function of VGAM364 is therefore inhibition of LOC255565 (Accession XM\_170811). Accordingly, utilities of VGAM364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255565. LOC256512 (Accession XM\_171470) is another VGAM364 host target gene. LOC256512 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC256512, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256512 BINDING SITE, designated SEQ ID:46047, to the nucleotide sequence of VGAM364 RNA, herein designated VGAM RNA, also designated SEQ ID:3075.

[18404] Another function of VGAM364 is therefore inhibition of LOC256512 (Accession XM\_171470). Accordingly, utilities of VGAM364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256512. LOC93166 (Accession XM\_049619) is another VGAM364 host target gene. LOC93166 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC93166, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93166 BINDING SITE, designated SEQ ID:35459, to the nucleotide sequence of VGAM364 RNA, herein designated VGAM RNA, also designated SEQ ID:3075.

[18405] Another function of VGAM364 is therefore inhibition of LOC93166 (Accession XM\_049619). Accordingly, utilities of VGAM364 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93166. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 365 (VGAM365) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18406] VGAM365 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM365 was detected is described hereinabove with reference to Figs. 1–8.

[18407] VGAM365 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Infectious Bronchitis Virus. VGAM365 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18408] VGAM365 gene encodes a VGAM365 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM365 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM365 precursor RNA is designated SEQ ID:351, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:351 is located at position 21704 relative to the genome of Avian Infectious Bronchitis Virus.

[18409] VGAM365 precursor RNA folds onto itself, forming VGAM365 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18410] An enzyme complex designated DICER COMPLEX, `dices` the VGAM365 folded precursor RNA into VGAM365 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM365 RNA is designated SEQ ID:3076, and is provided hereinbelow with reference to the sequence listing part.

[18411] VGAM365 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM365 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM365 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18412] VGAM365 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM365 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM365 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM365 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM365 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18413] The complementary binding of VGAM365 RNA, herein designated VGAM RNA, to host target binding sites on VGAM365 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM365 host target RNA into VGAM365 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[18414] It is appreciated that VGAM365 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM365 host target genes. The mRNA of each one of this plurality of VGAM365 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM365 RNA, herein designated VGAM RNA, and which when bound by VGAM365 RNA causes inhibition of translation of respective one or more VGAM365 host target proteins.

[18415] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM365 gene, herein designated VGAM GENE, on one or more VGAM365 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[18416] It is yet further appreciated that a function of VGAM365 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM365 include diagnosis, prevention and treatment of viral infection by Avian Infectious Bronchitis Virus. Specific functions, and accordingly utilities, of VGAM365 correlate with, and may be deduced from, the identity of the host target genes which VGAM365 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18417] Nucleotide sequences of the VGAM365 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM365 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM365 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM365 are further described hereinbelow with reference to Table 1.

[18418] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM365 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM365 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18419] As mentioned hereinabove with reference to Fig. 1, a function of VGAM365 gene, herein designated VGAM is inhibition of expression of VGAM365 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM365 correlate with, and may be deduced from, the identity of the target genes which VGAM365 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18420] Chromosome 20 Open Reading Frame 21 (C20orf21, Accession NM\_017798) is a VGAM365 host target gene. C20orf21 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf21, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf21 BINDING SITE, designated SEQ ID:19442, to the nucleotide sequence of VGAM365 RNA,

herein designated VGAM RNA, also designated SEQ ID:3076.

[18421] A function of VGAM365 is therefore inhibition of Chromosome 20 Open Reading Frame 21 (C20orf21, Accession NM\_017798). Accordingly, utilities of VGAM365 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf21. G Protein-coupled Receptor Kinase-interactor 2 (GIT2, Accession NM\_014776) is another VGAM365 host target gene. GIT2 BINDING SITE1 through GIT2 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GIT2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GIT2 BINDING SITE1 through GIT2 BINDING SITE3, designated SEQ ID:16595, SEQ ID:27677 and SEQ ID:27690 respectively, to the nucleotide sequence of VGAM365 RNA, herein designated VGAM RNA, also designated SEQ ID:3076.

[18422] Another function of VGAM365 is therefore inhibition of G Protein-coupled Receptor Kinase-interactor 2 (GIT2, Accession NM\_014776). Accordingly, utilities of VGAM365 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with GIT2. MO25 (Accession NM\_016289) is another VGAM365 host target gene. MO25 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MO25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MO25 BINDING SITE, designated SEQ ID:18412, to the nucleotide sequence of VGAM365 RNA, herein designated VGAM RNA, also designated SEQ ID:3076.

[18423] Another function of VGAM365 is therefore inhibition of MO25 (Accession NM\_016289). Accordingly, utilities of VGAM365 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MO25. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 366 (VGAM366) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18424] VGAM366 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM366 was detected is described hereinabove with reference to Figs. 1–8.

[18425] VGAM366 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Infectious Bronchitis Virus. VGAM366 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18426] VGAM366 gene encodes a VGAM366 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM366 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM366 precursor RNA is designated SEQ ID:352, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:352 is located at position 23096 relative to the genome of Avian Infectious Bronchitis Virus.

[18427] VGAM366 precursor RNA folds onto itself, forming VGAM366 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18428] An enzyme complex designated DICER COMPLEX, `dices` the VGAM366 folded precursor RNA into VGAM366 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM366 RNA is designated SEQ ID:3077, and is provided hereinbelow with reference to the sequence listing part.

[18429] VGAM366 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM366 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM366 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18430] VGAM366 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM366 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM366 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM366 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM366 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[18431] The complementary binding of VGAM366 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM366 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM366 host target RNA into VGAM366 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18432] It is appreciated that VGAM366 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM366 host target genes. The mRNA of each one of this plurality of VGAM366 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM366 RNA, herein designated VGAM RNA, and which when bound by VGAM366 RNA causes inhibition of translation of respective one or more VGAM366 host target proteins.

[18433] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM366 gene, herein designated VGAM GENE, on one or more VGAM366 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[18434] It is yet further appreciated that a function of VGAM366 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM366 include diagnosis, prevention and treatment of viral infection by Avian Infectious Bronchitis Virus. Specific functions, and accordingly utilities, of VGAM366 correlate with, and may be deduced from, the identity of the host target genes which VGAM366 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18435] Nucleotide sequences of the VGAM366 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM366 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM366 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM366 are further described hereinbelow with reference to Table 1.

[18436] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM366 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM366 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18437] As mentioned hereinabove with reference to Fig. 1, a function of VGAM366 gene, herein designated VGAM is inhibition of expression of VGAM366 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM366 correlate with, and may be deduced from, the identity of the target genes which VGAM366 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18438] Secretory Carrier Membrane Protein 1 (SCAMP1, Accession NM\_004866) is a VGAM366 host target gene. SCAMP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCAMP1,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCAMP1 BINDING SITE, designated SEQ ID:11291, to the nucleotide sequence of VGAM366 RNA, herein designated VGAM RNA, also designated SEQ ID:3077.

[18439] A function of VGAM366 is therefore inhibition of Secretory Carrier Membrane Protein 1 (SCAMP1, Accession NM\_004866), a gene which functions in post-golgi recycling pathways and acts as a recycling carrier to the cell surface. Accordingly, utilities of VGAM366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCAMP1. The function of SCAMP1 has been established by previous studies. Brand and Castle (1993) cloned SCAMP1, which they called SCAMP37, from a rat brain cDNA library. By screening a HeLa cell cDNA library with the rat cDNA as probe, Singleton et al. (1997) cloned human SCAMP1. They also identified 2 other paralogs, SCAMP2 (OMIM Ref. No. 606912) and SCAMP3 (OMIM Ref. No. 606913), from the HeLa cell library. SCAMP1 encodes a deduced 338-amino acid protein with a calculated molecular mass of 38 kD. The pro-

tein shares structural features with SCAMP2 and SCAMP3, including a leucine zipper-like segment, a proline-rich element, an extended central core that includes 4 putative transmembrane domains, a polar segment, and an alanine-rich C terminus. SCAMP1 shares 54% and 57% overall sequence identity with SCAMP2 and SCAMP3, respectively, and 98% identity with the rat homolog. The most divergent regions are in the N terminus. Northern blot analysis detected a 3.3-kb SCAMP1 transcript in all tissues examined, with highest expression in heart, brain, skeletal muscle, and pancreas, intermediate levels in placenta and liver, and low expression in lung and kidney. Immunofluorescent localization in HeLa cells showed punctate staining enriched in the perinuclear compartment and partial colocalization with SCAMP2 and SCAMP3.

[18440] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18441] Brand, S. H.; Castle, J. D. : SCAMP-37, a new marker within the general cell surface recycling system. EMBO J. 12: 3753-3761, 1993. ; and

[18442] Singleton, D. R.; Wu, T. T.; Castle, J. D. : Three mammalian SCAMPs (secretory carrier membrane proteins) are highly

related products of distinct genes having similar subcellular distrib.

[18443] Further studies establishing the function and utilities of SCAMP1 are found in John Hopkins OMIM database record ID 606911, and in cited publications numbered 513 and 8801 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Bladder Cancer Associated Protein (BLCAP, Accession NM\_006698) is another VGAM366 host target gene. BLCAP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BLCAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BLCAP BINDING SITE, designated SEQ ID:13521, to the nucleotide sequence of VGAM366 RNA, herein designated VGAM RNA, also designated SEQ ID:3077.

[18444] Another function of VGAM366 is therefore inhibition of Bladder Cancer Associated Protein (BLCAP, Accession NM\_006698). Accordingly, utilities of VGAM366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BLCAP. Chromosome 20 Open Reading Frame 108 (C20orf108, Accession

NM\_080821) is another VGAM366 host target gene.

C20orf108 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf108, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf108 BINDING SITE, designated SEQ ID:28082, to the nucleotide sequence of VGAM366 RNA, herein designated VGAM RNA, also designated SEQ ID:3077.

[18445] Another function of VGAM366 is therefore inhibition of Chromosome 20 Open Reading Frame 108 (C20orf108, Accession NM\_080821). Accordingly, utilities of VGAM366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf108.

FLJ32332 (Accession NM\_144641) is another VGAM366 host target gene. FLJ32332 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ32332, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32332 BINDING SITE, designated SEQ ID:29467, to the nucleotide sequence of

VGAM366 RNA, herein designated VGAM RNA, also designated SEQ ID:3077.

[18446] Another function of VGAM366 is therefore inhibition of FLJ32332 (Accession NM\_144641). Accordingly, utilities of VGAM366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32332. KIAA0350 (Accession XM\_028332) is another VGAM366 host target gene. KIAA0350 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0350 BINDING SITE, designated SEQ ID:30662, to the nucleotide sequence of VGAM366 RNA, herein designated VGAM RNA, also designated SEQ ID:3077.

[18447] Another function of VGAM366 is therefore inhibition of KIAA0350 (Accession XM\_028332). Accordingly, utilities of VGAM366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0350. KIAA0515 (Accession XM\_033380) is another VGAM366 host target gene. KIAA0515 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA0515, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0515 BINDING SITE, designated SEQ ID:31921, to the nucleotide sequence of VGAM366 RNA, herein designated VGAM RNA, also designated SEQ ID:3077.

[18448] Another function of VGAM366 is therefore inhibition of KIAA0515 (Accession XM\_033380). Accordingly, utilities of VGAM366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0515. LOC221405 (Accession XM\_168138) is another VGAM366 host target gene. LOC221405 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221405, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221405 BINDING SITE, designated SEQ ID:45067, to the nucleotide sequence of VGAM366 RNA, herein designated VGAM RNA, also designated SEQ ID:3077.

[18449] Another function of VGAM366 is therefore inhibition of LOC221405 (Accession XM\_168138). Accordingly, utilities

of VGAM366 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221405. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 367 (VGAM367) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18450] VGAM367 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM367 was detected is described hereinabove with reference to Figs. 1–8.

[18451] VGAM367 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Infectious Bronchitis Virus. VGAM367 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18452] VGAM367 gene encodes a VGAM367 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM367 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM367 precursor RNA is designated SEQ ID:353, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:353 is located at position 22094 relative to the genome of Avian Infectious Bronchitis Virus.

[18453] VGAM367 precursor RNA folds onto itself, forming VGAM367 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18454] An enzyme complex designated DICER COMPLEX, `dices` the VGAM367 folded precursor RNA into VGAM367 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM367 RNA is designated SEQ ID:3078, and

is provided hereinbelow with reference to the sequence listing part.

[18455] VGAM367 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM367 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM367 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18456] VGAM367 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM367 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM367 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM367 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM367 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18457] The complementary binding of VGAM367 RNA, herein designated VGAM RNA, to host target binding sites on VGAM367 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM367 host target RNA into VGAM367 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18458] It is appreciated that VGAM367 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM367 host target genes. The mRNA of each one of this plurality of VGAM367 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM367 RNA, herein designated VGAM RNA, and which when bound by VGAM367 RNA causes inhibition of translation of respective one or more VGAM367 host target proteins.

[18459] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM367 gene, herein designated VGAM GENE, on one or more VGAM367 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[18460] It is yet further appreciated that a function of VGAM367 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM367 include diagnosis, prevention and treatment of viral infection by Avian Infectious Bronchitis Virus. Specific functions, and accordingly utilities, of VGAM367 correlate with, and may be deduced from, the identity of the host target genes which VGAM367 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18461] Nucleotide sequences of the VGAM367 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM367 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM367 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM367 are further described hereinbelow with reference to Table 1.

[18462] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM367 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM367 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18463] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM367 gene, herein designated VGAM is inhibition of expression of VGAM367 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM367 correlate with, and may be deduced from, the identity of the target genes which VGAM367 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18464] Cyclin F (CCNF, Accession NM\_001761) is a VGAM367 host target gene. CCNF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CCNF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCNF BINDING SITE, designated SEQ ID:7525, to the nucleotide sequence of VGAM367 RNA, herein designated VGAM RNA, also designated SEQ ID:3078.

[18465] A function of VGAM367 is therefore inhibition of Cyclin F (CCNF, Accession NM\_001761), a gene which likely to be involved in the control of the cell cycle during s phase and g2. Accordingly, utilities of VGAM367 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCNF. The function of CCNF has

been established by previous studies. While searching in the 16p13.3 region for candidate genes for autosomal dominant polycystic kidney disease (PKD1; 173900), Kraus et al. (1994) identified a new member of the cyclin family. They characterized the transcript by sequencing, determination of exon/intron boundaries, and Northern blot analysis. Cyclin F is related to cyclins A (CCNA; 123835) and B (CCNB; 123836) by sequence, but its function is unknown. Cyclin F is the largest known human cyclin. Obermayr et al. (1995) mapped the gene to mouse chromosome 17 by analysis of hamster/mouse or human/mouse somatic cell hybrids containing Robertsonian translocations. For more accurate mapping, they used the BXD recombinant inbred strain system. Bai et al. (1996) determined that SKP1 (OMIM Ref. No. 601434) binds to CCNF, SKP2 (OMIM Ref. No. 601436), and potentially to other regulatory proteins that may be involved in ubiquitin proteolysis. Binding occurs through a novel motif, termed the F box. The F box contains about 40 residues and, in approximately half of the F-box proteins identified by Bai et al. (1996), it was associated with leucine-rich regions (LRRs), as in SKP2, or with WD40 repeats, as in BTRC (OMIM Ref. No. 603482). The F-box only proteins, including CCNF, contain no other

recognizable motifs.

[18466] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18467] Kraus, B.; Pohlschmidt, M.; Leung, A. L. S.; Germino, G. G.; Snarey, A.; Schneider, M. C.; Reeders, S. T.; Frischauf, A.-M. : A novel cyclin gene (CCNF) in the region of the polycystic kidney disease gene (PKD1). Genomics 24: 27-33, 1994. ; and

[18468] Bai, C.; Sen, P.; Hofmann, K.; Ma, L.; Goebel, M.; Harper, J. W.; Elledge, S. J. : SKP1 connects cell cycle regulators to the ubiquitin proteolysis machinery through a novel motif, the F-.

[18469] Further studies establishing the function and utilities of CCNF are found in John Hopkins OMIM database record ID 600227, and in cited publications numbered 7551-7553 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Disrupted In Renal Carcinoma 1 (DIRC1, Accession NM\_052952) is another VGAM367 host target gene. DIRC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DIRC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DIRC1 BINDING SITE, designated SEQ ID:27508, to the nucleotide sequence of VGAM367 RNA, herein designated VGAM RNA, also designated SEQ ID:3078.

[18470] Another function of VGAM367 is therefore inhibition of Disrupted In Renal Carcinoma 1 (DIRC1, Accession NM\_052952), a gene which disrupted in renal carcinoma. Accordingly, utilities of VGAM367 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIRC1. The function of DIRC1 has been established by previous studies. Podolski et al. (2001) described a reciprocal, balanced, constitutional chromosome translocation, t(2;3)(q33;q21), that is associated with familial clear cell renal cancer. By standard positional cloning strategies, Druck et al. (2001) isolated a gene disrupted by the chromosome 2 breakpoint. The gene, designated DIRC1 (disrupted in renal cancer-1), was disrupted between exons 1 and 2 by the familial translocation. The 1.5-kb DIRC1 mRNA encoded an 11-kD predicted protein of 104 amino acids. RT-PCR analysis detected low-level expression of DIRC1 in adult placenta, testis, ovary, and prostate, and in fetal kidney, spleen, and

skeletal muscle. Two familial tumors showed loss of the derivative chromosome 3, as observed in a Dutch kindred with t(2;3)-associated renal cancers in a Dutch family; see 602773. Druck et al. (2001) concluded that further studies were necessary to determine if inactivation of the DIRC1 gene contributes to the development of familial cancers.

[18471] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18472] Druck, T.; Podolski, J.; Byrski, T.; Wyrwicz, L.; Zajaczek, S.; Kata, G.; Borowka, A.; Lubinski, J.; Huebner, K. : The DIRC1 gene at chromosome 2q33 spans a familial RCC-associated t(2;3)(q33;q21) chromosome translocation. J. Hum. Genet. 46: 583–589, 2001. ; and

[18473] Podolski, J.; Zajaczek, S.; Byrski, T.; Druck, T.; Zimonjic, D. B.; Popescu, N. C.; Lubinski, J.; Huebner, K. : Characterization of a familial RCC-associated t(2;3)(q33;q21) chromosome.

[18474] Further studies establishing the function and utilities of DIRC1 are found in John Hopkins OMIM database record ID 606423, and in cited publications numbered 4541–4542 listed in the bibliography section hereinbelow, which are also hereby incorporated by refer–

ence.KIAA0022 (Accession NM\_014880) is another VGAM367 host target gene. KIAA0022 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0022, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0022 BINDING SITE, designated SEQ ID:17028, to the nucleotide sequence of VGAM367 RNA, herein designated VGAM RNA, also designated SEQ ID:3078.

[18475] Another function of VGAM367 is therefore inhibition of KIAA0022 (Accession NM\_014880). Accordingly, utilities of VGAM367 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0022. KIAA0265 (Accession XM\_045954) is another VGAM367 host target gene. KIAA0265 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0265, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0265 BINDING SITE, designated SEQ ID:34625, to the nucleotide sequence of VGAM367 RNA, herein designated

VGAM RNA, also designated SEQ ID:3078.

[18476] Another function of VGAM367 is therefore inhibition of KIAA0265 (Accession XM\_045954). Accordingly, utilities of VGAM367 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0265. KIAA0352 (Accession NM\_014830) is another VGAM367 host target gene. KIAA0352 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0352, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0352 BINDING SITE, designated SEQ ID:16822, to the nucleotide sequence of VGAM367 RNA, herein designated VGAM RNA, also designated SEQ ID:3078.

[18477] Another function of VGAM367 is therefore inhibition of KIAA0352 (Accession NM\_014830). Accordingly, utilities of VGAM367 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0352. KIAA1040 (Accession XM\_051091) is another VGAM367 host target gene. KIAA1040 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1040, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1040 BINDING SITE, designated SEQ ID:35744, to the nucleotide sequence of VGAM367 RNA, herein designated VGAM RNA, also designated SEQ ID:3078.

[18478] Another function of VGAM367 is therefore inhibition of KIAA1040 (Accession XM\_051091). Accordingly, utilities of VGAM367 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1040. KIAA1093 (Accession XM\_039385) is another VGAM367 host target gene. KIAA1093 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1093, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1093 BINDING SITE, designated SEQ ID:33064, to the nucleotide sequence of VGAM367 RNA, herein designated VGAM RNA, also designated SEQ ID:3078.

[18479] Another function of VGAM367 is therefore inhibition of KIAA1093 (Accession XM\_039385). Accordingly, utilities of VGAM367 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1093. PFTAIRE Protein Kinase 1 (PFTK1, Accession NM\_012395) is another VGAM367 host target gene. PFTK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PFTK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PFTK1 BINDING SITE, designated SEQ ID:14754, to the nucleotide sequence of VGAM367 RNA, herein designated VGAM RNA, also designated SEQ ID:3078.

[18480] Another function of VGAM367 is therefore inhibition of PFTAIRE Protein Kinase 1 (PFTK1, Accession NM\_012395). Accordingly, utilities of VGAM367 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PFTK1. LOC150468 (Accession XM\_086926) is another VGAM367 host target gene. LOC150468 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150468, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150468 BINDING SITE, desig-

nated SEQ ID:38975, to the nucleotide sequence of VGAM367 RNA, herein designated VGAM RNA, also designated SEQ ID:3078.

[18481] Another function of VGAM367 is therefore inhibition of LOC150468 (Accession XM\_086926). Accordingly, utilities of VGAM367 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150468. LOC158314 (Accession XM\_098920) is another VGAM367 host target gene. LOC158314 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158314, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158314 BINDING SITE, designated SEQ ID:41954, to the nucleotide sequence of VGAM367 RNA, herein designated VGAM RNA, also designated SEQ ID:3078.

[18482] Another function of VGAM367 is therefore inhibition of LOC158314 (Accession XM\_098920). Accordingly, utilities of VGAM367 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158314. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 368 (VGAM368) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18483] VGAM368 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM368 was detected is described hereinabove with reference to Figs. 1–8.

[18484] VGAM368 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Infectious Bronchitis Virus. VGAM368 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18485] VGAM368 gene encodes a VGAM368 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM368 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM368 precursor RNA is designated SEQ ID:354, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:354 is located at position 22912 relative to the genome of Avian

## Infectious Bronchitis Virus.

[18486] VGAM368 precursor RNA folds onto itself, forming VGAM368 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18487] An enzyme complex designated DICER COMPLEX, `dices` the VGAM368 folded precursor RNA into VGAM368 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM368 RNA is designated SEQ ID:3079, and is provided hereinbelow with reference to the sequence listing part.

[18488] VGAM368 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM368 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM368 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18489] VGAM368 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM368 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM368 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM368 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM368 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18490] The complementary binding of VGAM368 RNA, herein designated VGAM RNA, to host target binding sites on VGAM368 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM368 host target RNA into VGAM368 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18491] It is appreciated that VGAM368 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM368 host target genes. The mRNA of each one of this plurality of VGAM368 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM368 RNA, herein designated VGAM RNA, and which when bound by VGAM368 RNA causes inhibition of translation of respective one or more VGAM368 host target proteins.

[18492] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM368 gene, herein designated VGAM GENE, on one or more VGAM368 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[18493] It is yet further appreciated that a function of VGAM368 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM368 include diagnosis, prevention and treatment of viral infection by Avian Infectious Bronchitis Virus. Specific functions, and accordingly utilities, of

VGAM368 correlate with, and may be deduced from, the identity of the host target genes which VGAM368 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18494] Nucleotide sequences of the VGAM368 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM368 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM368 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM368 are further described hereinbelow with reference to Table 1.

[18495] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM368 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM368 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18496] As mentioned hereinabove with reference to Fig. 1, a function of VGAM368 gene, herein designated VGAM is inhibition of expression of VGAM368 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM368 correlate with, and may be deduced

from, the identity of the target genes which VGAM368 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18497] Aryl Hydrocarbon Receptor (AHR, Accession NM\_001621) is a VGAM368 host target gene. AHR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AHR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AHR BINDING SITE, designated SEQ ID:7337, to the nucleotide sequence of VGAM368 RNA, herein designated VGAM RNA, also designated SEQ ID:3079.

[18498] A function of VGAM368 is therefore inhibition of Aryl Hydrocarbon Receptor (AHR, Accession NM\_001621), a gene which plays a role in modulating carcinogenesis through the induction of xenobiotic-metabolizing enzymes. Accordingly, utilities of VGAM368 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AHR. The function of AHR has been established by previous studies. Halogenated aromatic hydrocarbons, represented by 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD), are envi-

ronmental pollutants that are produced by minor side-reactions in chemical manufacturing processes and by combustion of waste materials. These chemicals cause potent and pleiotropic toxicity, including teratogenesis, immune suppression, epithelial disorders, and tumor production in experimental animals. At the molecular level, aldehyde dehydrogenase, quinone reductase, and various drug-metabolizing enzymes are induced by the chemicals in some cultured cells and some tissues of experimental animals. All these biologic effects are thought to be mediated by an intracellular aryl hydrocarbon receptor (AHR). By fluorescence in situ hybridization and by DNA blot hybridization using human/mouse or human/Chinese hamster hybrid cell DNAs, Ema et al. (1994) assigned the AHR gene to 7p21. By use of PCR analysis of somatic cell hybrids and fluorescence in situ hybridization of metaphase cells, Le Beau et al. (1994) localized the AHR gene to 7p21-p15. Micka et al. (1997) localized the AHR gene to 7p15 using fluorescence in situ hybridization. Performing linkage analysis in a 3-generation family, they showed with good probability that the high CYP1A1 (OMIM Ref. No. 108330) inducibility phenotype segregates with the 7p15 region. Animal model experiments lend further sup-

port to the function of AHR. To determine whether the aryl hydrocarbon receptor plays a role in modulating carcinogenesis through the induction of xenobiotic-metabolizing enzymes, Shimizu et al. (2000) studied Ahr-deficient mice exposed to benzo(a)pyrene, a widely distributed environmental carcinogen.

[18499] It is appreciated that the abovementioned animal model for AHR is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[18500] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18501] Ema, M.; Matsushita, N.; Sogawa, K.; Ariyama, T.; Inazawa, J.; Nemoto, T.; Ota, M.; Oshimura, M.; Fujii-Kuriyama, Y. : Human arylhydrocarbon receptor: functional expression and chromosomal assignment to 7p21. J. Biochem. 116: 845-851, 1994. ; and

[18502] Shimizu, Y.; Nakatsuru, Y.; Ichinose, M.; Takahashi, Y.; Kume, H.; Mimura, J.; Fujii-Kuriyama, Y.; Ishikawa, T. : Benzo[a]pyrene carcinogenicity is lost in mice lacking the aryl hydrocar.

[18503] Further studies establishing the function and utilities of

AHR are found in John Hopkins OMIM database record ID 600253, and in cited publications numbered 8279–8281, 771 and 8282–8283 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Astrotactin (ASTN, Accession XM\_045113) is another VGAM368 host target gene. ASTN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ASTN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ASTN BINDING SITE, designated SEQ ID:34363, to the nucleotide sequence of VGAM368 RNA, herein designated VGAM RNA, also designated SEQ ID:3079.

[18504] Another function of VGAM368 is therefore inhibition of Astrotactin (ASTN, Accession XM\_045113). Accordingly, utilities of VGAM368 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASTN. Estrogen-related Receptor Beta Like 1 (ESRRBL1, Accession NM\_018010) is another VGAM368 host target gene. ESRRBL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ESRRBL1, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESRRBL1 BINDING SITE, designated SEQ ID:19740, to the nucleotide sequence of VGAM368 RNA, herein designated VGAM RNA, also designated SEQ ID:3079.

[18505] Another function of VGAM368 is therefore inhibition of Estrogen-related Receptor Beta Like 1 (ESRRBL1, Accession NM\_018010). Accordingly, utilities of VGAM368 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESRRBL1. Guanylate Cyclase 1, Soluble, Alpha 3 (GUCY1A3, Accession XM\_032838) is another VGAM368 host target gene. GUCY1A3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GUCY1A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GUCY1A3 BINDING SITE, designated SEQ ID:31778, to the nucleotide sequence of VGAM368 RNA, herein designated VGAM RNA, also designated SEQ ID:3079.

[18506] Another function of VGAM368 is therefore inhibition of

Guanylate Cyclase 1, Soluble, Alpha 3 (GUCY1A3, Accession XM\_032838), a gene which is alpha 1 (alpha 3) subunit of soluble guanylate cyclase and forms a heterodimer with GUCY1B3 that converts GTP to cGMP. Accordingly, utilities of VGAM368 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GUCY1A3. The function of GUCY1A3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM206.L-3-hydroxyacyl-Coenzyme A Dehydrogenase, Short Chain (HADHSC, Accession NM\_005327) is another VGAM368 host target gene. HADHSC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HADHSC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HADHSC BINDING SITE, designated SEQ ID:11799, to the nucleotide sequence of VGAM368 RNA, herein designated VGAM RNA, also designated SEQ ID:3079.

[18507] Another function of VGAM368 is therefore inhibition of L-3-hydroxyacyl-Coenzyme A Dehydrogenase, Short Chain

(HADHSC, Accession NM\_005327). Accordingly, utilities of VGAM368 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HADHSC. Interleukin 24 (IL24, Accession NM\_006850) is another VGAM368 host target gene. IL24 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL24 BINDING SITE, designated SEQ ID:13720, to the nucleotide sequence of VGAM368 RNA, herein designated VGAM RNA, also designated SEQ ID:3079.

[18508] Another function of VGAM368 is therefore inhibition of Interleukin 24 (IL24, Accession NM\_006850), a gene which may contribute to terminal cell differentiation. Accordingly, utilities of VGAM368 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL24. The function of IL24 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM258. Phosphatase and Tensin Homolog (mutated in multiple advanced cancers 1) (PTEN,

Accession NM\_000314) is another VGAM368 host target gene. PTEN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTEN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTEN BINDING SITE, designated SEQ ID:5858, to the nucleotide sequence of VGAM368 RNA, herein designated VGAM RNA, also designated SEQ ID:3079.

[18509] Another function of VGAM368 is therefore inhibition of Phosphatase and Tensin Homolog (mutated in multiple advanced cancers 1) (PTEN, Accession NM\_000314). Accordingly, utilities of VGAM368 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTEN. Retinoic Acid Receptor, Beta (RARβ, Accession NM\_016152) is another VGAM368 host target gene. RARβ BINDING SITE1 and RARβ BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RARβ, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RARβ BINDING SITE1 and RARβ BINDING SITE2, designated SEQ ID:18236 and

SEQ ID:6692 respectively, to the nucleotide sequence of VGAM368 RNA, herein designated VGAM RNA, also designated SEQ ID:3079.

[18510] Another function of VGAM368 is therefore inhibition of Retinoic Acid Receptor, Beta (RARβ, Accession NM\_016152), a gene which is one member of the steroid/thyroid hormone receptor family of ligand-activated transcription factors. Accordingly, utilities of VGAM368 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RARβ. The function of RARβ and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM179. A Kinase (PRKA) Anchor Protein 11 (AKAP11, Accession NM\_016248) is another VGAM368 host target gene. AKAP11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AKAP11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP11 BINDING SITE, designated SEQ ID:18366, to the nucleotide sequence of VGAM368 RNA, herein designated VGAM RNA, also designated SEQ

ID:3079.

[18511] Another function of VGAM368 is therefore inhibition of A Kinase (PRKA) Anchor Protein 11 (AKAP11, Accession NM\_016248). Accordingly, utilities of VGAM368 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP11. BMF (Accession NM\_033503) is another VGAM368 host target gene. BMF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BMF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BMF BINDING SITE, designated SEQ ID:27281, to the nucleotide sequence of VGAM368 RNA, herein designated VGAM RNA, also designated SEQ ID:3079.

[18512] Another function of VGAM368 is therefore inhibition of BMF (Accession NM\_033503). Accordingly, utilities of VGAM368 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BMF. C1q and Tumor Necrosis Factor Related Protein 7 (C1QTNF7, Accession NM\_031911) is another VGAM368 host target gene. C1QTNF7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by C1QTNF7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1QTNF7 BINDING SITE, designated SEQ ID:25667, to the nucleotide sequence of VGAM368 RNA, herein designated VGAM RNA, also designated SEQ ID:3079.

[18513] Another function of VGAM368 is therefore inhibition of C1q and Tumor Necrosis Factor Related Protein 7 (C1QTNF7, Accession NM\_031911). Accordingly, utilities of VGAM368 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1QTNF7. Chromosome 6 Open Reading Frame 37 (C6orf37, Accession XM\_041375) is another VGAM368 host target gene. C6orf37 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C6orf37, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C6orf37 BINDING SITE, designated SEQ ID:33513, to the nucleotide sequence of VGAM368 RNA, herein designated VGAM RNA, also designated SEQ ID:3079.

[18514] Another function of VGAM368 is therefore inhibition of Chromosome 6 Open Reading Frame 37 (C6orf37, Accession XM\_041375). Accordingly, utilities of VGAM368 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf37. Claudin 1 (CLDN1, Accession NM\_021101) is another VGAM368 host target gene. CLDN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLDN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLDN1 BINDING SITE, designated SEQ ID:22082, to the nucleotide sequence of VGAM368 RNA, herein designated VGAM RNA, also designated SEQ ID:3079.

[18515] Another function of VGAM368 is therefore inhibition of Claudin 1 (CLDN1, Accession NM\_021101). Accordingly, utilities of VGAM368 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLDN1. DKFZP434K0427 (Accession NM\_032148) is another VGAM368 host target gene. DKFZP434K0427 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DK-

FZP434K0427, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434K0427 BINDING SITE, designated SEQ ID:25840, to the nucleotide sequence of VGAM368 RNA, herein designated VGAM RNA, also designated SEQ ID:3079.

[18516] Another function of VGAM368 is therefore inhibition of DKFZP434K0427 (Accession NM\_032148). Accordingly, utilities of VGAM368 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434K0427. DKFZP586P0123 (Accession XM\_170681) is another VGAM368 host target gene. DKFZP586P0123 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP586P0123, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586P0123 BINDING SITE, designated SEQ ID:45465, to the nucleotide sequence of VGAM368 RNA, herein designated VGAM RNA, also designated SEQ ID:3079.

[18517] Another function of VGAM368 is therefore inhibition of

DKFZP586P0123 (Accession XM\_170681). Accordingly, utilities of VGAM368 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586P0123. FLJ10283 (Accession NM\_018046) is another VGAM368 host target gene. FLJ10283 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ10283, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10283 BINDING SITE, designated SEQ ID:19795, to the nucleotide sequence of VGAM368 RNA, herein designated VGAM RNA, also designated SEQ ID:3079.

[18518] Another function of VGAM368 is therefore inhibition of FLJ10283 (Accession NM\_018046). Accordingly, utilities of VGAM368 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10283. FLJ10525 (Accession NM\_018126) is another VGAM368 host target gene. FLJ10525 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10525, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ10525 BINDING SITE, designated SEQ ID:19914, to the nucleotide sequence of VGAM368 RNA, herein designated VGAM RNA, also designated SEQ ID:3079.

[18519] Another function of VGAM368 is therefore inhibition of FLJ10525 (Accession NM\_018126). Accordingly, utilities of VGAM368 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10525. KIAA0410 (Accession NM\_014778) is another VGAM368 host target gene. KIAA0410 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0410, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0410 BINDING SITE, designated SEQ ID:16615, to the nucleotide sequence of VGAM368 RNA, herein designated VGAM RNA, also designated SEQ ID:3079.

[18520] Another function of VGAM368 is therefore inhibition of KIAA0410 (Accession NM\_014778). Accordingly, utilities of VGAM368 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0410. MGC16384 (Accession NM\_053048) is another

VGAM368 host target gene. MGC16384 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC16384, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16384 BINDING SITE, designated SEQ ID:27595, to the nucleotide sequence of VGAM368 RNA, herein designated VGAM RNA, also designated SEQ ID:3079.

[18521] Another function of VGAM368 is therefore inhibition of MGC16384 (Accession NM\_053048). Accordingly, utilities of VGAM368 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16384. SAE1 (Accession NM\_005500) is another VGAM368 host target gene. SAE1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SAE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SAE1 BINDING SITE, designated SEQ ID:12003, to the nucleotide sequence of VGAM368 RNA, herein designated VGAM RNA, also designated SEQ ID:3079.

[18522] Another function of VGAM368 is therefore inhibition of SAE1 (Accession NM\_005500). Accordingly, utilities of VGAM368 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SAE1. SDS3 (Accession XM\_045014) is another VGAM368 host target gene. SDS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SDS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDS3 BINDING SITE, designated SEQ ID:34320, to the nucleotide sequence of VGAM368 RNA, herein designated VGAM RNA, also designated SEQ ID:3079.

[18523] Another function of VGAM368 is therefore inhibition of SDS3 (Accession XM\_045014). Accordingly, utilities of VGAM368 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDS3. Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4G (SEMA4G, Accession XM\_170638) is another VGAM368 host target gene. SEMA4G BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by SEMA4G, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA4G BINDING SITE, designated SEQ ID:45414, to the nucleotide sequence of VGAM368 RNA, herein designated VGAM RNA, also designated SEQ ID:3079.

[18524] Another function of VGAM368 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4G (SEMA4G, Accession XM\_170638). Accordingly, utilities of VGAM368 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA4G. LOC113115 (Accession NM\_138419) is another VGAM368 host target gene. LOC113115 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC113115, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC113115 BINDING SITE, designated SEQ ID:28789, to the nucleotide sequence of VGAM368 RNA, herein designated VGAM RNA, also design-

nated SEQ ID:3079.

[18525] Another function of VGAM368 is therefore inhibition of LOC113115 (Accession NM\_138419). Accordingly, utilities of VGAM368 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC113115. LOC125228 (Accession XM\_058913) is another VGAM368 host target gene. LOC125228 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC125228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC125228 BINDING SITE, designated SEQ ID:36791, to the nucleotide sequence of VGAM368 RNA, herein designated VGAM RNA, also designated SEQ ID:3079.

[18526] Another function of VGAM368 is therefore inhibition of LOC125228 (Accession XM\_058913). Accordingly, utilities of VGAM368 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC125228. LOC144848 (Accession XM\_056770) is another VGAM368 host target gene. LOC144848 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144848, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144848 BINDING SITE, designated SEQ ID:36422, to the nucleotide sequence of VGAM368 RNA, herein designated VGAM RNA, also designated SEQ ID:3079.

[18527] Another function of VGAM368 is therefore inhibition of LOC144848 (Accession XM\_056770). Accordingly, utilities of VGAM368 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144848. LOC145622 (Accession XM\_085186) is another VGAM368 host target gene. LOC145622 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145622, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145622 BINDING SITE, designated SEQ ID:37913, to the nucleotide sequence of VGAM368 RNA, herein designated VGAM RNA, also designated SEQ ID:3079.

[18528] Another function of VGAM368 is therefore inhibition of LOC145622 (Accession XM\_085186). Accordingly, utilities of VGAM368 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC145622. LOC151996 (Accession XM\_098151) is another VGAM368 host target gene. LOC151996 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151996, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151996 BINDING SITE, designated SEQ ID:41415, to the nucleotide sequence of VGAM368 RNA, herein designated VGAM RNA, also designated SEQ ID:3079.

[18529] Another function of VGAM368 is therefore inhibition of LOC151996 (Accession XM\_098151). Accordingly, utilities of VGAM368 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151996. LOC157273 (Accession XM\_098743) is another VGAM368 host target gene. LOC157273 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC157273, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157273 BINDING SITE, designated SEQ ID:41780, to

the nucleotide sequence of VGAM368 RNA, herein designated VGAM RNA, also designated SEQ ID:3079.

[18530] Another function of VGAM368 is therefore inhibition of LOC157273 (Accession XM\_098743). Accordingly, utilities of VGAM368 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157273. LOC160897 (Accession XM\_090573) is another VGAM368 host target gene. LOC160897 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC160897, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC160897 BINDING SITE, designated SEQ ID:40010, to the nucleotide sequence of VGAM368 RNA, herein designated VGAM RNA, also designated SEQ ID:3079.

[18531] Another function of VGAM368 is therefore inhibition of LOC160897 (Accession XM\_090573). Accordingly, utilities of VGAM368 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC160897. LOC200347 (Accession XM\_114219) is another VGAM368 host target gene. LOC200347 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC200347, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200347 BINDING SITE, designated SEQ ID:42807, to the nucleotide sequence of VGAM368 RNA, herein designated VGAM RNA, also designated SEQ ID:3079.

[18532] Another function of VGAM368 is therefore inhibition of LOC200347 (Accession XM\_114219). Accordingly, utilities of VGAM368 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200347. LOC220729 (Accession XM\_049575) is another VGAM368 host target gene. LOC220729 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220729, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220729 BINDING SITE, designated SEQ ID:35448, to the nucleotide sequence of VGAM368 RNA, herein designated VGAM RNA, also designated SEQ ID:3079.

[18533] Another function of VGAM368 is therefore inhibition of LOC220729 (Accession XM\_049575). Accordingly, utilities

of VGAM368 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220729. LOC256337 (Accession XM\_170643) is another VGAM368 host target gene. LOC256337 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256337 BINDING SITE, designated SEQ ID:45419, to the nucleotide sequence of VGAM368 RNA, herein designated VGAM RNA, also designated SEQ ID:3079.

[18534] Another function of VGAM368 is therefore inhibition of LOC256337 (Accession XM\_170643). Accordingly, utilities of VGAM368 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256337. LOC90342 (Accession XM\_031009) is another VGAM368 host target gene. LOC90342 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90342, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC90342 BINDING SITE, designated SEQ ID:31256, to the nucleotide sequence of VGAM368 RNA, herein designated VGAM RNA, also designated SEQ ID:3079.

[18535] Another function of VGAM368 is therefore inhibition of LOC90342 (Accession XM\_031009). Accordingly, utilities of VGAM368 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90342. LOC96810 (Accession XM\_047273) is another VGAM368 host target gene. LOC96810 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC96810, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC96810 BINDING SITE, designated SEQ ID:34926, to the nucleotide sequence of VGAM368 RNA, herein designated VGAM RNA, also designated SEQ ID:3079.

[18536] Another function of VGAM368 is therefore inhibition of LOC96810 (Accession XM\_047273). Accordingly, utilities of VGAM368 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC96810. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 369 (VGAM369) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18537] VGAM369 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM369 was detected is described hereinabove with reference to Figs. 1–8.

[18538] VGAM369 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Infectious Bronchitis Virus. VGAM369 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18539] VGAM369 gene encodes a VGAM369 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM369 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM369 precursor RNA is designated SEQ ID:355, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:355 is located at position 16684 relative to the genome of Avian

## Infectious Bronchitis Virus.

[18540] VGAM369 precursor RNA folds onto itself, forming VGAM369 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18541] An enzyme complex designated DICER COMPLEX, `dices` the VGAM369 folded precursor RNA into VGAM369 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM369 RNA is designated SEQ ID:3080, and is provided hereinbelow with reference to the sequence listing part.

[18542] VGAM369 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM369 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM369 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18543] VGAM369 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM369 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM369 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM369 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM369 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[18544] The complementary binding of VGAM369 RNA, herein designated VGAM RNA, to host target binding sites on VGAM369 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM369 host target RNA into VGAM369 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18545] It is appreciated that VGAM369 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM369 host target genes. The mRNA of each one of this plurality of VGAM369 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM369 RNA, herein designated VGAM RNA, and which when bound by VGAM369 RNA causes inhibition of translation of respective one or more VGAM369 host target proteins.

[18546] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM369 gene, herein designated VGAM GENE, on one or more VGAM369 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[18547] It is yet further appreciated that a function of VGAM369 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM369 include diagnosis, prevention and treatment of viral infection by Avian Infectious Bronchitis Virus. Specific functions, and accordingly utilities, of

VGAM369 correlate with, and may be deduced from, the identity of the host target genes which VGAM369 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18548] Nucleotide sequences of the VGAM369 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM369 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM369 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM369 are further described hereinbelow with reference to Table 1.

[18549] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM369 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM369 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18550] As mentioned hereinabove with reference to Fig. 1, a function of VGAM369 gene, herein designated VGAM is inhibition of expression of VGAM369 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM369 correlate with, and may be deduced

from, the identity of the target genes which VGAM369 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18551] Cullin 3 (CUL3, Accession NM\_003590) is a VGAM369 host target gene. CUL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CUL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CUL3 BINDING SITE, designated SEQ ID:9645, to the nucleotide sequence of VGAM369 RNA, herein designated VGAM RNA, also designated SEQ ID:3080.

[18552] A function of VGAM369 is therefore inhibition of Cullin 3 (CUL3, Accession NM\_003590), a gene which may target other proteins for ubiquitin-dependent proteolysis. Accordingly, utilities of VGAM369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CUL3. The function of CUL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM143.Dihydropyrimidinase-like 3 (DPYSL3, Accession

NM\_001387) is another VGAM369 host target gene. DPYSL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DPYSL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DPYSL3 BINDING SITE, designated SEQ ID:7071, to the nucleotide sequence of VGAM369 RNA, herein designated VGAM RNA, also designated SEQ ID:3080.

[18553] Another function of VGAM369 is therefore inhibition of Dihydropyrimidinase-like 3 (DPYSL3, Accession NM\_001387), a gene which is a member of the dihydropyrimidinase family. Accordingly, utilities of VGAM369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DPYSL3. The function of DPYSL3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM24. Nuclear Factor (erythroid-derived 2)-like 1 (NFE2L1, Accession NM\_003204) is another VGAM369 host target gene. NFE2L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by NFE2L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFE2L1 BINDING SITE, designated SEQ ID:9196, to the nucleotide sequence of VGAM369 RNA, herein designated VGAM RNA, also designated SEQ ID:3080.

[18554] Another function of VGAM369 is therefore inhibition of Nuclear Factor (erythroid-derived 2)-like 1 (NFE2L1, Accession NM\_003204), a gene which may regulate expression of ferritin genes. Accordingly, utilities of VGAM369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFE2L1. The function of NFE2L1 has been established by previous studies. Chan et al. (1993) devised a complementation assay in yeast to clone mammalian transcription activators and used it to identify a distinct human bZIP transcription factor, NFE2L1, which they designated NRF1 (NFE2-related factor-1) because of its similarities to NFE2 (OMIM Ref. No. 601490). Chan et al. (1995) showed that the NFE2L1 gene encodes a 742-amino acid protein with a different molecular weight than either the p45 subunit (NFE2) or the Maf protein subunit (MafF, MafG (OMIM Ref. No.

602020), or MafK (OMIM Ref. No. 600197)) of nuclear factor erythroid-2. Chan et al. (1993) found that NFE2L1 activates transcription via NFE2-binding sites in yeast cells. The ubiquitous expression pattern of NFE2L1 and the range of promoters containing the NFE2-binding motif suggested that this gene may play a role in the regulation of heme synthesis and ferritin genes. Animal model experiments lend further support to the function of NFE2L1. To determine the function of Nrf1, Chan et al. (1998) disrupted the mouse gene by homologous recombination. Heterozygous Nrf1 mutant mice developed normally, were fertile, and showed no obvious abnormalities. Mice homozygous for the Nrf1 mutation suffered from anemia as a result of abnormal fetal liver erythropoiesis and died in utero at mid-late gestation. The authors did not detect defects in globin gene expression. Abnormal red cell production appeared to result from a defect in the fetal liver microenvironment specific for erythroid cells. Chan et al. (1998) suggested that target genes regulated by Nrf1 play an essential role during fetal liver hematopoiesis.

[18555] It is appreciated that the abovementioned animal model for NFE2L1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further ap-

preciated from the publications sited hereinbelow.

[18556] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18557] Chan, J. Y.; Kwong, M.; Lu, R.; Chang, J.; Wang, B.; Yen, T. S. B.; Kan, Y. W. : Targeted disruption of the ubiquitous CNC-bZIP transcription factor, Nrf-1, results in anemia and embryonic lethality in mice. EMBO J. 17: 1779-1787, 1998. ; and

[18558] Chan, J. Y.; Han, X.-L.; Kan, Y. W. : Cloning of Nrf1, an NF-E2-related transcription factor, by genetic selection in yeast. Proc. Nat. Acad. Sci. 90: 11371-11375, 1993.

[18559] Further studies establishing the function and utilities of NFE2L1 are found in John Hopkins OMIM database record ID 163260, and in sited publications numbered 10585-10591 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Single-minded Homolog 2 (Drosophila) (SIM2, Accession NM\_005069) is another VGAM369 host target gene. SIM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of SIM2 BINDING SITE, designated SEQ ID:11517, to the nucleotide sequence of VGAM369 RNA, herein designated VGAM RNA, also designated SEQ ID:3080.

[18560] Another function of VGAM369 is therefore inhibition of Single-minded Homolog 2 (Drosophila) (SIM2, Accession NM\_005069), a gene which may be a master gene of cns development. Accordingly, utilities of VGAM369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIM2. The function of SIM2 has been established by previous studies. Dahmane et al. (1995) noted that many features of Down syndrome might result from the overdosage of only a few genes located in the DCR around the 21q22.2 subband. To search for these genes, cosmids mapping to this region were isolated by Dahmane et al. (1995) and used for trapping exons. One of the trapped exons obtained had a sequence very similar to part of the Drosophila sim gene. Mapping data indicated that this exonic sequence is present only in the DCR in the human genome. Hybridization of this exonic sequence with human fetal kidney polyadenylated RNA revealed 2 transcripts of 6 and 4.3 kb. In situ hybridization of a probe derived from this exon with human and rat fe-

tuses showed that the corresponding gene is expressed during early fetal life in the central nervous system and in other tissues, including the facial, skeletal, palate, and vertebra primordia. The expression pattern of this gene suggested to the authors that it may be involved in the pathogenesis of some of the morphologic features and brain anomalies of Down syndrome. Animal model experiments lend further support to the function of SIM2. Chrast et al. (2000) created a bacterial artificial chromosome transgenic mice with 1 or 2 additional copies of mouse Sim2. The transgene was expressed in the same spatial pattern as the endogenous gene. The mice developed normally, were fertile, and did not show detectable histopathologic abnormalities. However, detailed analysis of their behavior revealed anxiety-related/reduced exploratory behavior and sensitivity to pain, phenotypes similar to those also present in other partial trisomy 16 mouse models of DS. The authors suggested that overexpression of SIM2 may contribute to the DS behavioral phenotype.

[18561] It is appreciated that the abovementioned animal model for SIM2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appre-

ciated from the publications sited hereinbelow.

[18562] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18563] Dahmane, N.; Charron, G.; Lopes, C.; Yaspo, M.-L.; Maunoury, C.; Decorte, L.; Sinet, P.-M.; Bloch, B.; Delabar, J.-M. : Down syndrome-critical region contains a gene homologous to *Drosophila* sim expressed during rat and human central nervous system development. *Proc. Nat. Acad. Sci.* 92: 9191-9195, 1995. ; and

[18564] Chrast, R.; Scott, H. S.; Madani, R.; Huber, L.; Wolfer, D. P.; Prinz, M.; Aguzzi, A.; Lipp, H.-P.; Antonarakis, S. E. : Mice trisomic for a bacterial artificial chromosome with the sim.

[18565] Further studies establishing the function and utilities of SIM2 are found in John Hopkins OMIM database record ID 600892, and in sited publications numbered 9290-929 and 9296 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. SORCS1 (Accession NM\_052918) is another VGAM369 host target gene. SORCS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SORCS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of SORCS1 BINDING SITE, designated SEQ ID:27483, to the nucleotide sequence of VGAM369 RNA, herein designated VGAM RNA, also designated SEQ ID:3080.

[18566] Another function of VGAM369 is therefore inhibition of SORCS1 (Accession NM\_052918). Accordingly, utilities of VGAM369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SORCS1. TNF Receptor-associated Factor 1 (TRAF1, Accession NM\_005658) is another VGAM369 host target gene. TRAF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRAF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRAF1 BINDING SITE, designated SEQ ID:12198, to the nucleotide sequence of VGAM369 RNA, herein designated VGAM RNA, also designated SEQ ID:3080.

[18567] Another function of VGAM369 is therefore inhibition of TNF Receptor-associated Factor 1 (TRAF1, Accession NM\_005658), a gene which signal transducer associated

with the cytoplasmic domain of the 75 kda tumor necrosis factor receptor (tnf-r2). Accordingly, utilities of VGAM369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAF1. The function of TRAF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM250. Vinculin (VCL, Accession NM\_003373) is another VGAM369 host target gene. VCL BINDING SITE1 and VCL BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by VCL, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VCL BINDING SITE1 and VCL BINDING SITE2, designated SEQ ID:9402 and SEQ ID:15191 respectively, to the nucleotide sequence of VGAM369 RNA, herein designated VGAM RNA, also designated SEQ ID:3080.

[18568] Another function of VGAM369 is therefore inhibition of Vinculin (VCL, Accession NM\_003373). Accordingly, utilities of VGAM369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VCL. FLJ20273 (Accession NM\_019027) is another

VGAM369 host target gene. FLJ20273 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20273, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20273 BINDING SITE, designated SEQ ID:21115, to the nucleotide sequence of VGAM369 RNA, herein designated VGAM RNA, also designated SEQ ID:3080.

[18569] Another function of VGAM369 is therefore inhibition of FLJ20273 (Accession NM\_019027). Accordingly, utilities of VGAM369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20273. FLJ21865 (Accession NM\_022759) is another VGAM369 host target gene. FLJ21865 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21865, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21865 BINDING SITE, designated SEQ ID:23001, to the nucleotide sequence of VGAM369 RNA, herein designated VGAM RNA, also designated SEQ ID:3080.

[18570] Another function of VGAM369 is therefore inhibition of FLJ21865 (Accession NM\_022759). Accordingly, utilities of VGAM369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21865. G Protein-coupled Receptor Kinase-interactor 1 (GIT1, Accession NM\_014030) is another VGAM369 host target gene. GIT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GIT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GIT1 BINDING SITE, designated SEQ ID:15258, to the nucleotide sequence of VGAM369 RNA, herein designated VGAM RNA, also designated SEQ ID:3080.

[18571] Another function of VGAM369 is therefore inhibition of G Protein-coupled Receptor Kinase-interactor 1 (GIT1, Accession NM\_014030). Accordingly, utilities of VGAM369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GIT1. KIAA0210 (Accession NM\_014744) is another VGAM369 host target gene. KIAA0210 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0210, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0210 BINDING SITE, designated SEQ ID:16421, to the nucleotide sequence of VGAM369 RNA, herein designated VGAM RNA, also designated SEQ ID:3080.

[18572] Another function of VGAM369 is therefore inhibition of KIAA0210 (Accession NM\_014744). Accordingly, utilities of VGAM369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0210. KIAA0336 (Accession NM\_014635) is another VGAM369 host target gene. KIAA0336 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0336, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0336 BINDING SITE, designated SEQ ID:16011, to the nucleotide sequence of VGAM369 RNA, herein designated VGAM RNA, also designated SEQ ID:3080.

[18573] Another function of VGAM369 is therefore inhibition of KIAA0336 (Accession NM\_014635). Accordingly, utilities of VGAM369 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0336. KIAA1130 (Accession XM\_031104) is another VGAM369 host target gene. KIAA1130 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1130, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1130 BINDING SITE, designated SEQ ID:31287, to the nucleotide sequence of VGAM369 RNA, herein designated VGAM RNA, also designated SEQ ID:3080.

[18574] Another function of VGAM369 is therefore inhibition of KIAA1130 (Accession XM\_031104). Accordingly, utilities of VGAM369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1130. KIAA1831 (Accession XM\_033366) is another VGAM369 host target gene. KIAA1831 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1831, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1831 BINDING SITE, designated SEQ ID:31907, to the

nucleotide sequence of VGAM369 RNA, herein designated VGAM RNA, also designated SEQ ID:3080.

[18575] Another function of VGAM369 is therefore inhibition of KIAA1831 (Accession XM\_033366). Accordingly, utilities of VGAM369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1831. MCJ (Accession NM\_013238) is another VGAM369 host target gene. MCJ BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MCJ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MCJ BINDING SITE, designated SEQ ID:14899, to the nucleotide sequence of VGAM369 RNA, herein designated VGAM RNA, also designated SEQ ID:3080.

[18576] Another function of VGAM369 is therefore inhibition of MCJ (Accession NM\_013238). Accordingly, utilities of VGAM369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCJ. Rabip4R (Accession NM\_017987) is another VGAM369 host target gene. Rabip4R BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA en-

coded by Rabip4R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Rabip4R BINDING SITE, designated SEQ ID:19717, to the nucleotide sequence of VGAM369 RNA, herein designated VGAM RNA, also designated SEQ ID:3080.

[18577] Another function of VGAM369 is therefore inhibition of Rabip4R (Accession NM\_017987). Accordingly, utilities of VGAM369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Rabip4R. Spi-B Transcription Factor (Spi-1/PU.1 related) (SPIB, Accession NM\_003121) is another VGAM369 host target gene. SPIB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPIB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPIB BINDING SITE, designated SEQ ID:9093, to the nucleotide sequence of VGAM369 RNA, herein designated VGAM RNA, also designated SEQ ID:3080.

[18578] Another function of VGAM369 is therefore inhibition of Spi-B Transcription Factor (Spi-1/PU.1 related) (SPIB, Ac-

cession NM\_003121). Accordingly, utilities of VGAM369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPIB. Ubinuclein 1 (UBN1, Accession NM\_016936) is another VGAM369 host target gene. UBN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBN1 BINDING SITE, designated SEQ ID:18854, to the nucleotide sequence of VGAM369 RNA, herein designated VGAM RNA, also designated SEQ ID:3080.

[18579] Another function of VGAM369 is therefore inhibition of Ubinuclein 1 (UBN1, Accession NM\_016936). Accordingly, utilities of VGAM369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBN1. LOC145368 (Accession XM\_085112) is another VGAM369 host target gene. LOC145368 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145368, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC145368 BINDING SITE, designated SEQ ID:37830, to the nucleotide sequence of VGAM369 RNA, herein designated VGAM RNA, also designated SEQ ID:3080.

[18580] Another function of VGAM369 is therefore inhibition of LOC145368 (Accession XM\_085112). Accordingly, utilities of VGAM369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145368. LOC150423 (Accession XM\_086912) is another VGAM369 host target gene. LOC150423 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150423 BINDING SITE, designated SEQ ID:38970, to the nucleotide sequence of VGAM369 RNA, herein designated VGAM RNA, also designated SEQ ID:3080.

[18581] Another function of VGAM369 is therefore inhibition of LOC150423 (Accession XM\_086912). Accordingly, utilities of VGAM369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150423. LOC153232 (Accession XM\_098331) is an-

other VGAM369 host target gene. LOC153232 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC153232, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153232 BINDING SITE, designated SEQ ID:41597, to the nucleotide sequence of VGAM369 RNA, herein designated VGAM RNA, also designated SEQ ID:3080.

[18582] Another function of VGAM369 is therefore inhibition of LOC153232 (Accession XM\_098331). Accordingly, utilities of VGAM369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153232. LOC221486 (Accession XM\_165760) is another VGAM369 host target gene. LOC221486 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC221486, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221486 BINDING SITE, designated SEQ ID:43746, to the nucleotide sequence of VGAM369 RNA, herein designated VGAM RNA, also designated SEQ ID:3080.

[18583] Another function of VGAM369 is therefore inhibition of LOC221486 (Accession XM\_165760). Accordingly, utilities of VGAM369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221486. LOC256310 (Accession XM\_172813) is another VGAM369 host target gene. LOC256310 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256310, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256310 BINDING SITE, designated SEQ ID:46096, to the nucleotide sequence of VGAM369 RNA, herein designated VGAM RNA, also designated SEQ ID:3080.

[18584] Another function of VGAM369 is therefore inhibition of LOC256310 (Accession XM\_172813). Accordingly, utilities of VGAM369 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256310. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 370 (VGAM370) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[18585] VGAM370 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM370 was detected is described hereinabove with reference to Figs. 1–8.

[18586] VGAM370 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Infectious Bronchitis Virus. VGAM370 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18587] VGAM370 gene encodes a VGAM370 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM370 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM370 precursor RNA is designated SEQ ID:356, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:356 is located at position 17287 relative to the genome of Avian Infectious Bronchitis Virus.

[18588] VGAM370 precursor RNA folds onto itself, forming VGAM370 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional  
`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[18589] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM370 folded precursor RNA into VGAM370 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 42%) nucleotide se-  
quence of VGAM370 RNA is designated SEQ ID:3081, and  
is provided hereinbelow with reference to the sequence  
listing part.

[18590] VGAM370 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM370 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM370 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18591] VGAM370 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM370 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM370 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM370 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM370 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18592] The complementary binding of VGAM370 RNA, herein designated VGAM RNA, to host target binding sites on VGAM370 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM370 host target RNA into VGAM370 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18593] It is appreciated that VGAM370 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM370 host target genes. The mRNA of each one of this plurality of VGAM370 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM370 RNA, herein designated VGAM RNA, and which when bound by VGAM370 RNA causes inhibition of translation of respective one or more VGAM370 host target proteins.

[18594] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM370 gene, herein designated VGAM GENE, on one or more VGAM370 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[18595] It is yet further appreciated that a function of VGAM370 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM370 include diagnosis, prevention and treatment of viral infection by Avian Infectious Bronchitis Virus. Specific functions, and accordingly utilities, of VGAM370 correlate with, and may be deduced from, the identity of the host target genes which VGAM370 binds and inhibits, and the function of these host target genes,

as elaborated hereinbelow.

[18596] Nucleotide sequences of the VGAM370 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM370 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM370 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM370 are further described hereinbelow with reference to Table 1.

[18597] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM370 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM370 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18598] As mentioned hereinabove with reference to Fig. 1, a function of VGAM370 gene, herein designated VGAM is inhibition of expression of VGAM370 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM370 correlate with, and may be deduced from, the identity of the target genes which VGAM370 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18599] N-ethylmaleimide-sensitive Factor (NSF, Accession XM\_032173) is a VGAM370 host target gene. NSF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NSF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NSF BINDING SITE, designated SEQ ID:31586, to the nucleotide sequence of VGAM370 RNA, herein designated VGAM RNA, also designated SEQ ID:3081.

[18600] A function of VGAM370 is therefore inhibition of N-ethylmaleimide-sensitive Factor (NSF, Accession XM\_032173), a gene which catalyzes the fusion of transport vesicles within the golgi cisternae. Accordingly, utilities of VGAM370 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NSF. The function of NSF has been established by previous studies. The process of vesicle targeting and fusion in the secretory and endocytic pathways has been described by the SNAREs hypothesis (Rothman, 1994). This proposes that vesicles dock with specific target membranes by binding to membrane-specific SNAREs (soluble N-ethylmaleimide-sensitive factors attachment protein re-

ceptors). Hoyle et al. (1996) noted that targeting specificity is also affected by the Rabs, a group of small soluble GTPases. After the vesicle has bound to the target membrane, the SNARE multimer is joined by the soluble SNAP proteins and N-ethylmaleimide-sensitive factor (NSF). The resulting large complex is thought to allow membrane fusion and the ATPase activity of the NSF appears to be essential for the process. Hoyle et al. (1996) stated that while many of different SNAREs, Rabs, and SNAPs are involved in membrane fusion, there is only 1 NSF, and the SNARE hypothesis describes NSF-dependent fusion. Mammalian N-ethylmaleimide-sensitive protein was first described by Glick and Rothman (1987) as the protein that restored the ability of Golgi membranes that had been inactivated with the reagent N-ethylmaleimide to re-engage in vesicular transport. The NSF gene was subsequently cloned from Chinese hamster cells by Block et al. (1988) and Wilson et al. (1989). NSF is a member of the AAA (ATPases associated with diverse cellular activities) gene family. Hoyle et al. (1996) stated that the genes are most related throughout the approximately 200-amino acid domain (the AAA domain) that binds ATP; however, the family is notable not only for its conservation but also for

diverse functions of its proteins in eukaryotic cells. The family can be subdivided into those with either 1 or 2 ATP-binding domains. NSF is a 2-domain member of the AAA family. Valosin-containing protein (OMIM Ref. No. 601023), which is also involved in membrane fusion, is another 2-AAA domain protein.

[18601] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18602] Glick, B. S.; Rothman, J. E. : Possible role for fatty acyl-coenzyme A in intracellular protein transport. *Nature* 326: 309-312, 1987. ; and

[18603] Hoyle, J.; Phelan, J. P.; Bermingham, N.; Fisher, E. M. C. : Localization of human and mouse N-ethylmaleimide-sensitive factor (NSF) gene: a two-domain member of the AAA family that is i.

[18604] Further studies establishing the function and utilities of NSF are found in John Hopkins OMIM database record ID 601633, and in cited publications numbered 2808-281 and 12358-2812 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Mitochondrial Ribosomal Protein L20 (MRPL20, Accession NM\_017971) is another VGAM370 host target

gene. MRPL20 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MRPL20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPL20 BINDING SITE, designated SEQ ID:19699, to the nucleotide sequence of VGAM370 RNA, herein designated VGAM RNA, also designated SEQ ID:3081.

[18605] Another function of VGAM370 is therefore inhibition of Mitochondrial Ribosomal Protein L20 (MRPL20, Accession NM\_017971). Accordingly, utilities of VGAM370 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL20. NUCKS (Accession NM\_022731) is another VGAM370 host target gene. NUCKS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NUCKS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUCKS BINDING SITE, designated SEQ ID:22936, to the nucleotide sequence of VGAM370 RNA, herein designated VGAM RNA, also designated SEQ

ID:3081.

[18606] Another function of VGAM370 is therefore inhibition of NUCKS (Accession NM\_022731). Accordingly, utilities of VGAM370 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUCKS. LOC146138 (Accession XM\_096938) is another VGAM370 host target gene. LOC146138 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146138, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146138 BINDING SITE, designated SEQ ID:40659, to the nucleotide sequence of VGAM370 RNA, herein designated VGAM RNA, also designated SEQ ID:3081.

[18607] Another function of VGAM370 is therefore inhibition of LOC146138 (Accession XM\_096938). Accordingly, utilities of VGAM370 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146138. LOC254250 (Accession XM\_173093) is another VGAM370 host target gene. LOC254250 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254250, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254250 BINDING SITE, designated SEQ ID:46356, to the nucleotide sequence of VGAM370 RNA, herein designated VGAM RNA, also designated SEQ ID:3081.

[18608] Another function of VGAM370 is therefore inhibition of LOC254250 (Accession XM\_173093). Accordingly, utilities of VGAM370 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254250. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 371 (VGAM371) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18609] VGAM371 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM371 was detected is described hereinabove with reference to Figs. 1–8.

[18610] VGAM371 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Infectious Bron-

chitis Virus. VGAM371 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18611] VGAM371 gene encodes a VGAM371 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM371 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM371 precursor RNA is designated SEQ ID:357, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:357 is located at position 16829 relative to the genome of Avian Infectious Bronchitis Virus.

[18612] VGAM371 precursor RNA folds onto itself, forming VGAM371 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18613] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM371 folded precursor RNA into VGAM371 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM371 RNA is designated SEQ ID:3082, and is provided hereinbelow with reference to the sequence listing part.

[18614] VGAM371 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM371 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM371 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18615] VGAM371 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM371 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM371 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM371 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM371 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18616] The complementary binding of VGAM371 RNA, herein designated VGAM RNA, to host target binding sites on VGAM371 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM371 host target RNA into VGAM371 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18617] It is appreciated that VGAM371 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM371 host target genes. The mRNA of each one of this plurality of VGAM371 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM371 RNA, herein designated VGAM RNA, and which when bound by VGAM371 RNA causes inhibition of translation of respective one or more VGAM371 host target proteins.

[18618] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM371 gene, herein designated VGAM GENE, on one or more VGAM371 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[18619] It is yet further appreciated that a function of VGAM371 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM371 include diagnosis, prevention and treatment of viral infection by Avian Infectious Bronchitis Virus. Specific functions, and accordingly utilities, of VGAM371 correlate with, and may be deduced from, the identity of the host target genes which VGAM371 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18620] Nucleotide sequences of the VGAM371 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM371 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM371 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM371 are further described hereinbelow with reference to Table 1.

[18621] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM371 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM371 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18622] As mentioned hereinabove with reference to Fig. 1, a function of VGAM371 gene, herein designated VGAM is inhibition of expression of VGAM371 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM371 correlate with, and may be deduced from, the identity of the target genes which VGAM371 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18623] SRGAP2 (Accession XM\_059095) is a VGAM371 host target gene. SRGAP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SRGAP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRGAP2 BINDING SITE, designated SEQ ID:36877, to the nucleotide sequence of VGAM371 RNA,

herein designated VGAM RNA, also designated SEQ ID:3082.

[18624] A function of VGAM371 is therefore inhibition of SRGAP2 (Accession XM\_059095). Accordingly, utilities of VGAM371 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRGAP2. ADAMTS-like 1 (ADAMTSL1, Accession NM\_139264) is another VGAM371 host target gene. ADAMTSL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADAMTSL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAMTSL1 BINDING SITE, designated SEQ ID:29253, to the nucleotide sequence of VGAM371 RNA, herein designated VGAM RNA, also designated SEQ ID:3082.

[18625] Another function of VGAM371 is therefore inhibition of ADAMTS-like 1 (ADAMTSL1, Accession NM\_139264). Accordingly, utilities of VGAM371 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAMTSL1. Carbohydrate (chondroitin 6) Sulfotransferase 3 (CHST3, Accession NM\_004273) is another VGAM371 host target gene. CHST3 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CHST3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHST3 BINDING SITE, designated SEQ ID:10472, to the nucleotide sequence of VGAM371 RNA, herein designated VGAM RNA, also designated SEQ ID:3082.

[18626] Another function of VGAM371 is therefore inhibition of Carbohydrate (chondroitin 6) Sulfotransferase 3 (CHST3, Accession NM\_004273). Accordingly, utilities of VGAM371 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHST3. KIAA1344 (Accession XM\_051699) is another VGAM371 host target gene. KIAA1344 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1344, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1344 BINDING SITE, designated SEQ ID:35868, to the nucleotide sequence of VGAM371 RNA, herein designated VGAM RNA, also designated SEQ ID:3082.

[18627] Another function of VGAM371 is therefore inhibition of KIAA1344 (Accession XM\_051699). Accordingly, utilities of VGAM371 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1344. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 372 (VGAM372) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18628] VGAM372 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM372 was detected is described hereinabove with reference to Figs. 1–8.

[18629] VGAM372 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Infectious Bronchitis Virus. VGAM372 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18630] VGAM372 gene encodes a VGAM372 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM372

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM372 precursor RNA is designated SEQ ID:358, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:358 is located at position 11416 relative to the genome of Avian Infectious Bronchitis Virus.

[18631] VGAM372 precursor RNA folds onto itself, forming VGAM372 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18632] An enzyme complex designated DICER COMPLEX, `dices` the VGAM372 folded precursor RNA into VGAM372 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 53%) nucleotide sequence of VGAM372 RNA is designated SEQ ID:3083, and is provided hereinbelow with reference to the sequence listing part.

[18633] VGAM372 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM372 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM372 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[18634] VGAM372 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM372 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM372 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM372 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM372 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18635] The complementary binding of VGAM372 RNA, herein designated VGAM RNA, to host target binding sites on VGAM372 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM372 host target RNA into VGAM372 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18636] It is appreciated that VGAM372 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM372 host target genes. The mRNA of each one of this plurality of VGAM372 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM372 RNA, herein designated VGAM RNA, and which when bound by VGAM372 RNA causes inhibition of translation of respective one or more VGAM372 host target proteins.

[18637] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM372 gene, herein designated VGAM GENE, on one or more VGAM372 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[18638] It is yet further appreciated that a function of VGAM372 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM372 include diagnosis, prevention and treatment of viral infection by Avian Infectious Bronchitis Virus. Specific functions, and accordingly utilities, of VGAM372 correlate with, and may be deduced from, the identity of the host target genes which VGAM372 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18639] Nucleotide sequences of the VGAM372 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM372 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM372 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM372 are further described hereinbelow with reference to Table 1.

[18640] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM372 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM372 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[18641] As mentioned hereinabove with reference to Fig. 1, a function of VGAM372 gene, herein designated VGAM is inhibition of expression of VGAM372 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM372 correlate with, and may be deduced from, the identity of the target genes which VGAM372 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18642] Annexin A8 (ANXA8, Accession NM\_001630) is a VGAM372 host target gene. ANXA8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ANXA8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANXA8 BINDING SITE, designated SEQ ID:7339, to the nucleotide sequence of VGAM372 RNA, herein designated VGAM RNA, also designated SEQ ID:3083.

[18643] A function of VGAM372 is therefore inhibition of Annexin A8 (ANXA8, Accession NM\_001630), a gene which acts as an indirect inhibitor of the thromboplastin-specific complex, which is involved in the blood coagulation cascade.

Accordingly, utilities of VGAM372 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANXA8. The function of ANXA8 has been established by previous studies. Human annexin VIII was originally identified by Hauptmann et al. (1989) from a 2-kb cDNA transcript containing an open reading frame that encoded a 327-amino acid protein termed vascular anticoagulant beta. It is a minor annexin (see OMIM Ref. No. ANXA2; 151740) in human placenta and shows restricted expression in lung endothelia, skin, liver, and kidney. The gene is selectively overexpressed in acute myelocytic leukemia (Chang et al., 1992). Affected human promyelocytes contain a nonrandom chromosomal translocation breakpoint involving chromosomes 15 and 17 and creating 2 hybrid mRNA fusion products and chimeric proteins. These involve the retinoic acid receptor alpha locus (RARA; 180240) on 17q12 and the promyelocytic leukemia locus (PML; 102578) on 15q22. Chambers et al. (1992) mapped the ANXA8 gene to 10q11.2 by fluorescence in situ hybridization, thus excluding its direct involvement in the breakpoint region. However, strong overexpression of annexin VIII in this disorder could be repressed by retinoic acid-induced expression of the

## RARA gene product

- [18644] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [18645] Chang, K.-S.; Wang, G.; Freireich, E. J.; Daly, M.; Naylor, S. L.; Trujillo, J. M.; Stass, S. A. : Specific expression of the annexin VIII gene in acute promyelocytic leukemia. *Blood* 79: 1802–1810, 1992. ; and
- [18646] Sarkar, A.; Yang, P.; Fan, Y.-H.; Mu, Z. M.; Hauptmann, R.; Adolf, G. R.; Stass, S. A.; Chang, K.-S. : Regulation of the expression of annexin VIII in acute promyelocytic leukemia. *Blood*.
- [18647] Further studies establishing the function and utilities of ANXA8 are found in John Hopkins OMIM database record ID 602396, and in cited publications numbered 5902–5904, 484 and 5905 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Inositol Polyphosphate-5-phosphatase, 75kDa (INPP5B, Accession XM\_170949) is another VGAM372 host target gene. INPP5B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by INPP5B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of INPP5B BINDING SITE, designated SEQ ID:45734, to the nucleotide sequence of VGAM372 RNA, herein designated VGAM RNA, also designated SEQ ID:3083.

[18648] Another function of VGAM372 is therefore inhibition of Inositol Polyphosphate-5-phosphatase, 75kDa (INPP5B, Accession XM\_170949), a gene which hydrolyzes the calcium-mobilizing second messenger  $\text{ins}(1,4,5)\text{p3}$ . Accordingly, utilities of VGAM372 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INPP5B. The function of INPP5B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM50.N-ethylmaleimide-sensitive Factor (NSF, Accession XM\_032173) is another VGAM372 host target gene. NSF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NSF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NSF BINDING SITE, designated SEQ ID:31588, to the nu-

cleotide sequence of VGAM372 RNA, herein designated VGAM RNA, also designated SEQ ID:3083.

[18649] Another function of VGAM372 is therefore inhibition of N-ethylmaleimide-sensitive Factor (NSF, Accession XM\_032173), a gene which catalyzes the fusion of transport vesicles within the golgi cisternae. Accordingly, utilities of VGAM372 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NSF. The function of NSF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM370. Chromosome 13 Open Reading Frame 1 (C13orf1, Accession NM\_020456) is another VGAM372 host target gene. C13orf1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C13orf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C13orf1 BINDING SITE, designated SEQ ID:21690, to the nucleotide sequence of VGAM372 RNA, herein designated VGAM RNA, also designated SEQ ID:3083.

[18650] Another function of VGAM372 is therefore inhibition of

Chromosome 13 Open Reading Frame 1 (C13orf1, Accession NM\_020456). Accordingly, utilities of VGAM372 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C13orf1. MGC12972 (Accession NM\_032683) is another VGAM372 host target gene. MGC12972 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC12972, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12972 BINDING SITE, designated SEQ ID:26405, to the nucleotide sequence of VGAM372 RNA, herein designated VGAM RNA, also designated SEQ ID:3083.

[18651] Another function of VGAM372 is therefore inhibition of MGC12972 (Accession NM\_032683). Accordingly, utilities of VGAM372 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12972. Paternally Expressed 10 (PEG10, Accession NM\_015068) is another VGAM372 host target gene. PEG10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PEG10, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEG10 BINDING SITE, designated SEQ ID:17429, to the nucleotide sequence of VGAM372 RNA, herein designated VGAM RNA, also designated SEQ ID:3083.

[18652] Another function of VGAM372 is therefore inhibition of Paternally Expressed 10 (PEG10, Accession NM\_015068). Accordingly, utilities of VGAM372 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEG10. LOC142972 (Accession XM\_036593) is another VGAM372 host target gene. LOC142972 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC142972, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC142972 BINDING SITE, designated SEQ ID:32476, to the nucleotide sequence of VGAM372 RNA, herein designated VGAM RNA, also designated SEQ ID:3083.

[18653] Another function of VGAM372 is therefore inhibition of LOC142972 (Accession XM\_036593). Accordingly, utilities

of VGAM372 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC142972. LOC92140 (Accession XM\_043070) is another VGAM372 host target gene. LOC92140 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92140, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92140 BINDING SITE, designated SEQ ID:33889, to the nucleotide sequence of VGAM372 RNA, herein designated VGAM RNA, also designated SEQ ID:3083.

[18654] Another function of VGAM372 is therefore inhibition of LOC92140 (Accession XM\_043070). Accordingly, utilities of VGAM372 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92140. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 373 (VGAM373) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18655] VGAM373 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM373 was detected is described hereinabove with reference to Figs. 1–8.

[18656] VGAM373 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Infectious Bronchitis Virus. VGAM373 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18657] VGAM373 gene encodes a VGAM373 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM373 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM373 precursor RNA is designated SEQ ID:359, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:359 is located at position 14350 relative to the genome of Avian Infectious Bronchitis Virus.

[18658] VGAM373 precursor RNA folds onto itself, forming VGAM373 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18659] An enzyme complex designated DICER COMPLEX, `dices` the VGAM373 folded precursor RNA into VGAM373 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM373 RNA is designated SEQ ID:3084, and is provided hereinbelow with reference to the sequence listing part.

[18660] VGAM373 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM373 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM373 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[18661] VGAM373 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM373 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM373 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM373 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM373 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18662] The complementary binding of VGAM373 RNA, herein designated VGAM RNA, to host target binding sites on VGAM373 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM373 host target RNA into VGAM373 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18663] It is appreciated that VGAM373 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM373 host target genes. The mRNA of each one of this plurality of VGAM373 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM373 RNA, herein designated VGAM RNA, and which when bound by VGAM373 RNA causes inhibition of translation of respective one or more VGAM373 host target proteins.

[18664] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM373 gene, herein designated VGAM GENE, on one or more VGAM373 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[18665] It is yet further appreciated that a function of VGAM373 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM373 include diagnosis, prevention and treatment of viral infection by Avian Infectious Bronchitis Virus. Specific functions, and accordingly utilities, of VGAM373 correlate with, and may be deduced from, the identity of the host target genes which VGAM373 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18666] Nucleotide sequences of the VGAM373 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM373 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM373 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM373 are further  
described hereinbelow with reference to Table 1.

[18667] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM373 host target RNA, and schematic  
representation of the complementarity of each of these  
host target binding sites to VGAM373 RNA, herein desig-  
nated VGAM RNA, are described hereinbelow with refer-  
ence to Table 2.

[18668] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM373 gene, herein designated VGAM is  
inhibition of expression of VGAM373 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM373 correlate with, and may be deduced  
from, the identity of the target genes which VGAM373  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[18669] Potassium Inwardly-rectifying Channel, Subfamily J, Mem-  
ber 15 (KCNJ15, Accession NM\_002243) is a VGAM373

host target gene. KCNJ15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNJ15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNJ15 BINDING SITE, designated SEQ ID:8031, to the nucleotide sequence of VGAM373 RNA, herein designated VGAM RNA, also designated SEQ ID:3084.

[18670] A function of VGAM373 is therefore inhibition of Potassium Inwardly-rectifying Channel, Subfamily J, Member 15 (KCNJ15, Accession NM\_002243). Accordingly, utilities of VGAM373 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ15. Cyclin M1 (CNNM1, Accession NM\_020348) is another VGAM373 host target gene. CNNM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNNM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNNM1 BINDING SITE, designated SEQ ID:21605, to the nucleotide sequence of VGAM373 RNA, herein designated VGAM RNA,

also designated SEQ ID:3084.

[18671] Another function of VGAM373 is therefore inhibition of Cyclin M1 (CNNM1, Accession NM\_020348). Accordingly, utilities of VGAM373 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNNM1. DKFZp761N1114 (Accession XM\_086327) is another VGAM373 host target gene. DKFZp761N1114 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp761N1114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761N1114 BINDING SITE, designated SEQ ID:38606, to the nucleotide sequence of VGAM373 RNA, herein designated VGAM RNA, also designated SEQ ID:3084.

[18672] Another function of VGAM373 is therefore inhibition of DKFZp761N1114 (Accession XM\_086327). Accordingly, utilities of VGAM373 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761N1114. KIAA0323 (Accession XM\_032634) is another VGAM373 host target gene. KIAA0323 BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by KIAA0323, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0323 BINDING SITE, designated SEQ ID:31688, to the nucleotide sequence of VGAM373 RNA, herein designated VGAM RNA, also designated SEQ ID:3084.

[18673] Another function of VGAM373 is therefore inhibition of KIAA0323 (Accession XM\_032634). Accordingly, utilities of VGAM373 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0323. KIAA0848 (Accession NM\_014926) is another VGAM373 host target gene. KIAA0848 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0848, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0848 BINDING SITE, designated SEQ ID:17213, to the nucleotide sequence of VGAM373 RNA, herein designated VGAM RNA, also designated SEQ ID:3084.

[18674] Another function of VGAM373 is therefore inhibition of KIAA0848 (Accession NM\_014926). Accordingly, utilities

of VGAM373 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0848. KIAA1200 (Accession XM\_031054) is another VGAM373 host target gene. KIAA1200 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1200, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1200 BINDING SITE, designated SEQ ID:31262, to the nucleotide sequence of VGAM373 RNA, herein designated VGAM RNA, also designated SEQ ID:3084.

[18675] Another function of VGAM373 is therefore inhibition of KIAA1200 (Accession XM\_031054). Accordingly, utilities of VGAM373 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1200. Mitogen-activated Protein Kinase 11 (MAPK11, Accession NM\_002751) is another VGAM373 host target gene. MAPK11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAPK11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of MAPK11 BINDING SITE, designated SEQ ID:8627, to the nucleotide sequence of VGAM373 RNA, herein designated VGAM RNA, also designated SEQ ID:3084.

[18676] Another function of VGAM373 is therefore inhibition of Mitogen-activated Protein Kinase 11 (MAPK11, Accession NM\_002751). Accordingly, utilities of VGAM373 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPK11. LOC133418 (Accession XM\_059649) is another VGAM373 host target gene. LOC133418 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC133418, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC133418 BINDING SITE, designated SEQ ID:37041, to the nucleotide sequence of VGAM373 RNA, herein designated VGAM RNA, also designated SEQ ID:3084.

[18677] Another function of VGAM373 is therefore inhibition of LOC133418 (Accession XM\_059649). Accordingly, utilities of VGAM373 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC133418. LOC153338 (Accession XM\_098361) is another VGAM373 host target gene. LOC153338 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153338, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153338 BINDING SITE, designated SEQ ID:41609, to the nucleotide sequence of VGAM373 RNA, herein designated VGAM RNA, also designated SEQ ID:3084.

[18678] Another function of VGAM373 is therefore inhibition of LOC153338 (Accession XM\_098361). Accordingly, utilities of VGAM373 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153338. LOC255098 (Accession XM\_170912) is another VGAM373 host target gene. LOC255098 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255098, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255098 BINDING SITE, designated SEQ ID:45689, to the nucleotide sequence of VGAM373 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3084.

[18679] Another function of VGAM373 is therefore inhibition of LOC255098 (Accession XM\_170912). Accordingly, utilities of VGAM373 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255098. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 374 (VGAM374) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18680] VGAM374 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM374 was detected is described hereinabove with reference to Figs. 1–8.

[18681] VGAM374 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Infectious Bronchitis Virus. VGAM374 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18682] VGAM374 gene encodes a VGAM374 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM374 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM374 precursor RNA is designated SEQ ID:360, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:360 is located at position 13667 relative to the genome of Avian Infectious Bronchitis Virus.

[18683] VGAM374 precursor RNA folds onto itself, forming VGAM374 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18684] An enzyme complex designated DICER COMPLEX, `dices` the VGAM374 folded precursor RNA into VGAM374 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 63%) nucleotide sequence of VGAM374 RNA is designated SEQ ID:3085, and is provided hereinbelow with reference to the sequence listing part.

[18685] VGAM374 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM374 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM374 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18686] VGAM374 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM374 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM374 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM374 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM374 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18687] The complementary binding of VGAM374 RNA, herein designated VGAM RNA, to host target binding sites on VGAM374 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM374 host target RNA into VGAM374 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18688] It is appreciated that VGAM374 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM374 host target genes. The mRNA of

each one of this plurality of VGAM374 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM374 RNA, herein designated VGAM RNA, and which when bound by VGAM374 RNA causes inhibition of translation of respective one or more VGAM374 host target proteins.

[18689] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM374 gene, herein designated VGAM GENE, on one or more VGAM374 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[18690] It is yet further appreciated that a function of VGAM374 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM374 include diagnosis, prevention and treatment of viral infection by Avian Infectious Bronchitis Virus. Specific functions, and accordingly utilities, of VGAM374 correlate with, and may be deduced from, the identity of the host target genes which VGAM374 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18691] Nucleotide sequences of the VGAM374 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM374 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM374 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM374 are further described hereinbelow with reference to Table 1.

[18692] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM374 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM374 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[18693] As mentioned hereinabove with reference to Fig. 1, a function of VGAM374 gene, herein designated VGAM is inhibition of expression of VGAM374 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM374 correlate with, and may be deduced from, the identity of the target genes which VGAM374 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18694] Acid Phosphatase 1, Soluble (ACP1, Accession NM\_004300) is a VGAM374 host target gene. ACP1 BINDING SITE1 and ACP1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ACP1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACP1 BINDING SITE1 and ACP1 BINDING SITE2, designated SEQ ID:10510 and SEQ ID:13960 respectively, to the nucleotide sequence of VGAM374 RNA, herein designated VGAM RNA, also designated SEQ ID:3085.

[18695] A function of VGAM374 is therefore inhibition of Acid

Phosphatase 1, Soluble (ACP1, Accession NM\_004300), a gene which as demonstrated in starch-gel electrophoresis. Accordingly, utilities of VGAM374 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACP1. The function of ACP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM179. Heparanase (HPSE, Accession NM\_006665) is another VGAM374 host target gene. HPSE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HPSE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HPSE BINDING SITE, designated SEQ ID:13480, to the nucleotide sequence of VGAM374 RNA, herein designated VGAM RNA, also designated SEQ ID:3085.

[18696] Another function of VGAM374 is therefore inhibition of Heparanase (HPSE, Accession NM\_006665), a gene which is an endoglycosidase that cleaves heparan sulfate. Accordingly, utilities of VGAM374 include diagnosis, prevention and treatment of diseases and clinical conditions as-

sociated with HPSE. The function of HPSE has been established by previous studies. Heparanase is an endoglycosidase that cleaves heparan sulfate, an important component of the extracellular matrix and vascular basal lamina. The degradation of heparan sulfate by heparanase is a key step in the extravasation of tumor cells and migrating leukocytes, but is also important in physiologic processes including angiogenesis, wound healing, and smooth muscle proliferation. By sequential affinity chromatography of SV40-transformed embryonic lung fibroblasts, Toyoshima and Nakajima (1999) purified a 50-kD protein with heparanase activity. Hulett et al. (1999) and Vlodavsky et al. (1999) applied similar strategies to platelets and placenta, respectively. By searching EST databases, all 3 groups identified cDNAs encoding a 543-amino acid heparanase protein (HPSE) with 6 potential N-glycosylation sites. The protein also has putative hydrophobic stretches suggestive of signal peptides and a transmembrane protein (Hulett et al., 1999). Northern blot analysis revealed expression of a 2-kb transcript in placenta but not in heart, brain, lung, liver, skeletal muscle, kidney, or pancreas. A 4.4-kb transcript is expressed at low levels in all tissues. Both transcripts are expressed

equivalently in peripheral blood leukocytes, spleen, lymph node, bone marrow, fetal liver, and thymus (Hulett et al., 1999; Kussie et al., 1999). Functional analyses revealed that expression correlates with heparanase activity (Toyoshima and Nakajima, 1999; Vlodavsky et al. (1999); Hulett et al., 1999). RT/PCR, in situ hybridization, and functional analyses demonstrated a correlation of gene expression and heparanase activity with increased metastatic potential in breast cancer tissues and cell lines (Vlodavsky et al., 1999).

[18697] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18698] Baker, E.; Crawford, J.; Sutherland, G. R.; Freeman, C.; Parish, C. R.; Hulett, M. D. : Human HPA endoglycosidase heparanase. *Chromosome Res.* 7: 319 only, 1999. ; and

[18699] Hulett, M. D.; Freeman, C.; Hamdorf, B. J.; Baker, R. T.; Harris, M. J.; Parish, C. R. : Cloning of mammalian heparanase, an important enzyme in tumor invasion and metastasis. *Nature M.*

[18700] Further studies establishing the function and utilities of HPSE are found in John Hopkins OMIM database record ID 604724, and in cited publications numbered 4994–4998

listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Selectin L (lymphocyte adhesion molecule 1) (SELL, Accession NM\_000655) is another VGAM374 host target gene. SELL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELL BINDING SITE, designated SEQ ID:6316, to the nucleotide sequence of VGAM374 RNA, herein designated VGAM RNA, also designated SEQ ID:3085.

[18701] Another function of VGAM374 is therefore inhibition of Selectin L (lymphocyte adhesion molecule 1) (SELL, Accession NM\_000655), a gene which is a cell surface adhesion protein. Accordingly, utilities of VGAM374 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELL. The function of SELL has been established by previous studies. This glycoprotein was first identified in the mouse as the Mel-14 antigen, a lymph node homing receptor (Lnhr) also found on neutrophils and monocytes, by Lasky et al. (1989). In addition to lymphocyte homing, this molecule may play a role in

neutrophil adhesion to endothelium at sites of inflammation. The human counterpart was referred to as the LEU8/TQ1 antigen. The human homolog of mouse lymph node homing receptor was cloned by Siegelman and Weissman (1989). Distech et al. (1989) and Tedder et al. (1989) mapped the LYAM1 gene to 1q23–q25 by in situ hybridization. The gene for another member of the adhesion molecule family, SELP (OMIM Ref. No. 173610), is located in this same area. Indeed, Watson et al. (1990) demonstrated that these 2 genes and that for endothelial leukocyte adhesion molecule–1 (SELE; 131210) map to the same 300–kb segment. Furthermore, Watson et al. (1990) found that these 3 genes are closely situated on distal mouse chromosome 1 which is syntenic with human chromosome 1q; in 428 meiotic events, no crossovers were identified among these 3 genes and the gene for coagulation factor V (OMIM Ref. No. 227400). Dowbenko et al. (1991) also mapped the gene to a region of mouse chromosome 1, very near a site previously shown to contain the genes for the family of complement regulatory proteins. They found, furthermore, a correspondence between the domains of the protein and the coding exons of the gene. In the course of constructing a physical map of

1q, Oakey et al. (1992) positioned LYAM between ELAM and SELP and gave the location of all 3, as well as of F5 (OMIM Ref. No. 227400), as 1q23–q25.

[18702] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18703] Lasky, L. A.; Singer, M. S.; Yednock, T. A.; Dowbenko, D.; Fennie, C.; Rodriguez, H.; Nguyen, T.; Stachel, S.; Rosen, S. D. : Cloning of a lymphocyte homing receptor reveals a lectin domain. Cell 56: 1045–1055, 1989. ; and

[18704] Oakey, R. J.; Watson, M. L.; Seldin, M. F. : Construction of a physical map on mouse and human chromosome 1: comparison of 13 Mb of mouse and 11 Mb of human DNA. Hum. Molec. Genet. 1: 6.

[18705] Further studies establishing the function and utilities of SELL are found in John Hopkins OMIM database record ID 153240, and in cited publications numbered 11805, 11353, 11503–11504, 3934, 11505–1150 and 11810 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.FLJ10287 (Accession NM\_019083) is another VGAM374 host target gene. FLJ10287 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded

by FLJ10287, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10287 BINDING SITE, designated SEQ ID:21154, to the nucleotide sequence of VGAM374 RNA, herein designated VGAM RNA, also designated SEQ ID:3085.

[18706] Another function of VGAM374 is therefore inhibition of FLJ10287 (Accession NM\_019083). Accordingly, utilities of VGAM374 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10287. Frequently Rearranged In Advanced T-cell Lymphomas (FRAT1, Accession NM\_005479) is another VGAM374 host target gene. FRAT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FRAT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FRAT1 BINDING SITE, designated SEQ ID:11982, to the nucleotide sequence of VGAM374 RNA, herein designated VGAM RNA, also designated SEQ ID:3085.

[18707] Another function of VGAM374 is therefore inhibition of

Frequently Rearranged In Advanced T-cell Lymphomas (FRAT1, Accession NM\_005479). Accordingly, utilities of VGAM374 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FRAT1. KIAA1143 (Accession XM\_044014) is another VGAM374 host target gene. KIAA1143 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1143, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1143 BINDING SITE, designated SEQ ID:34070, to the nucleotide sequence of VGAM374 RNA, herein designated VGAM RNA, also designated SEQ ID:3085.

[18708] Another function of VGAM374 is therefore inhibition of KIAA1143 (Accession XM\_044014). Accordingly, utilities of VGAM374 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1143. KIAA1283 (Accession XM\_050563) is another VGAM374 host target gene. KIAA1283 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1283, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1283 BINDING SITE, designated SEQ ID:35662, to the nucleotide sequence of VGAM374 RNA, herein designated VGAM RNA, also designated SEQ ID:3085.

[18709] Another function of VGAM374 is therefore inhibition of KIAA1283 (Accession XM\_050563). Accordingly, utilities of VGAM374 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1283. KIAA1719 (Accession XM\_042936) is another VGAM374 host target gene. KIAA1719 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1719 BINDING SITE, designated SEQ ID:33816, to the nucleotide sequence of VGAM374 RNA, herein designated VGAM RNA, also designated SEQ ID:3085.

[18710] Another function of VGAM374 is therefore inhibition of KIAA1719 (Accession XM\_042936). Accordingly, utilities of VGAM374 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1719. LIM and SH3 Protein 1 (LASP1, Accession NM\_006148) is another VGAM374 host target gene. LASP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LASP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LASP1 BINDING SITE, designated SEQ ID:12802, to the nucleotide sequence of VGAM374 RNA, herein designated VGAM RNA, also designated SEQ ID:3085.

[18711] Another function of VGAM374 is therefore inhibition of LIM and SH3 Protein 1 (LASP1, Accession NM\_006148). Accordingly, utilities of VGAM374 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LASP1. MGC4707 (Accession NM\_024113) is another VGAM374 host target gene. MGC4707 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4707, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4707 BINDING SITE, designated SEQ ID:23564, to the nucleotide sequence of VGAM374 RNA, herein designated

VGAM RNA, also designated SEQ ID:3085.

[18712] Another function of VGAM374 is therefore inhibition of MGC4707 (Accession NM\_024113). Accordingly, utilities of VGAM374 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4707. LOC150139 (Accession XM\_086794) is another VGAM374 host target gene. LOC150139 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150139 BINDING SITE, designated SEQ ID:38860, to the nucleotide sequence of VGAM374 RNA, herein designated VGAM RNA, also designated SEQ ID:3085.

[18713] Another function of VGAM374 is therefore inhibition of LOC150139 (Accession XM\_086794). Accordingly, utilities of VGAM374 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150139. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 375 (VGAM375) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18714] VGAM375 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM375 was detected is described hereinabove with reference to Figs. 1–8.

[18715] VGAM375 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Avian Infectious Bronchitis Virus. VGAM375 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18716] VGAM375 gene encodes a VGAM375 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM375 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM375 precursor RNA is designated SEQ ID:361, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:361 is located at position 19796 relative to the genome of Avian Infectious Bronchitis Virus.

[18717] VGAM375 precursor RNA folds onto itself, forming

VGAM375 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18718] An enzyme complex designated DICER COMPLEX, `dices` the VGAM375 folded precursor RNA into VGAM375 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 54%) nucleotide sequence of VGAM375 RNA is designated SEQ ID:3086, and is provided hereinbelow with reference to the sequence listing part.

[18719] VGAM375 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM375 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM375 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[18720] VGAM375 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM375 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM375 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM375 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM375 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18721] The complementary binding of VGAM375 RNA, herein designated VGAM RNA, to host target binding sites on VGAM375 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM375 host target RNA into VGAM375 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18722] It is appreciated that VGAM375 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM375 host target genes. The mRNA of each one of this plurality of VGAM375 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM375 RNA, herein designated VGAM RNA, and which when bound by VGAM375 RNA causes inhibition of translation of respective one or more VGAM375 host target proteins.

[18723] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM375 gene, herein designated VGAM GENE, on one or more VGAM375 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[18724] It is yet further appreciated that a function of VGAM375 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM375 include diagnosis, prevention and treatment of viral infection by Avian Infectious Bronchitis Virus. Specific functions, and accordingly utilities, of VGAM375 correlate with, and may be deduced from, the identity of the host target genes which VGAM375 binds

and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18725] Nucleotide sequences of the VGAM375 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM375 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM375 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM375 are further described hereinbelow with reference to Table 1.

[18726] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM375 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM375 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18727] As mentioned hereinabove with reference to Fig. 1, a function of VGAM375 gene, herein designated VGAM is inhibition of expression of VGAM375 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM375 correlate with, and may be deduced from, the identity of the target genes which VGAM375 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[18728] Nuclear Receptor Subfamily 5, Group A, Member 2 (NR5A2, Accession NM\_003822) is a VGAM375 host target gene. NR5A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NR5A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR5A2 BINDING SITE, designated SEQ ID:9916, to the nucleotide sequence of VGAM375 RNA, herein designated VGAM RNA, also designated SEQ ID:3086.

[18729] A function of VGAM375 is therefore inhibition of Nuclear Receptor Subfamily 5, Group A, Member 2 (NR5A2, Accession NM\_003822), a gene which is a member of nuclear receptor superfamily of transcriptional activators and activates the hepatitis B virus (HBV) promoter. Accordingly, utilities of VGAM375 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR5A2. The function of NR5A2 has been established by previous studies. By means of yeast one-hybrid screening of a liver cDNA library, Li et al. (1998) cloned a cDNA encoding a novel hepatocyte transcription factor,

which they called HB1F for human B1-binding factor. The deduced 495-amino acid protein, which has a molecular mass of 54 kD, belongs to the fushi tarazu factor-1 (OMIM Ref. No. FTZ-F1) subfamily of orphan nuclear receptors and is closely related to steroidogenic factor-1 (SF1; 184757), another member of this subfamily. HB1F contains a DNA-binding domain with 2 zinc finger motifs, an FTZ-F1 box, and a ligand-binding domain. Northern blot analysis revealed that HB1F is expressed in liver, pancreas, and lung as a 5.2-kb transcript. An additional transcript of 3.8 kb was present in hepatoma cells HepG2. The authors identified 2 HB1F isoforms which differ in their A/B region. HB1F specifically binds and activates viral hepatitis B enhancer II, an essential element for the liver-specific regulation of hepatitis B virus gene expression.

Cholesterol 7- $\alpha$ -hydroxylase is the first and rate-limiting enzyme in a pathway through which cholesterol is metabolized to bile acids. The gene encoding cholesterol 7- $\alpha$ -hydroxylase, CYP7A (OMIM Ref. No. 118455), is expressed exclusively in the liver. Overexpression of CYP7A in hamsters results in reduction of serum cholesterol levels, suggesting that the enzyme plays a central role in cholesterol homeostasis. Nitta et al. (1999) re-

ported the identification of a liver-specific transcription factor that binds to the promoter of the human CYP7A gene. They designated this factor CPF for 'CYP7A promoter-binding factor' and identified it as a human homolog of the *Drosophila* orphan nuclear receptor fushi tarazu F1 (OMIM Ref. No. Ftz-F1). Nitta et al. (1999) isolated a CPF cDNA encoding a 495-amino acid protein from a human liver cDNA library. They found evidence for 2 CPF variants derived from alternative splicing. Northern blot analysis detected enriched expression in pancreas and liver, with a low level of expression in heart and lung. Mutation of the CPF binding site within the CYP7A promoter abolished liver-specific expression of the gene in transient transfection assays. Cotransfection of a CPF expression plasmid and a CYP7A reporter gene resulted in specific induction of CYP7A-directed transcription. These observations suggested that CPF is a key regulator of human CYP7A gene expression in the liver.

transcription factor, hB1F, which binds and activates enhancer II of hepatitis B virus. J. Biol. Chem. 273: 29022–29031, 1998. ; and

[18732] Nitta, M.; Ku, S.; Brown, C.; Okamoto, A. Y.; Shan, B. : CPF: an orphan nuclear receptor that regulates liver-specific expression of the human cholesterol 7- $\alpha$ -hydroxylase gene. Proc.

[18733] Further studies establishing the function and utilities of NR5A2 are found in John Hopkins OMIM database record ID 604453, and in cited publications numbered 4762, 12136, 594 and 12138 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. CXYorf1 (Accession XM\_088704) is another VGAM375 host target gene. CXYorf1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CXYorf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXYorf1 BINDING SITE, designated SEQ ID:39908, to the nucleotide sequence of VGAM375 RNA, herein designated VGAM RNA, also designated SEQ ID:3086.

[18734] Another function of VGAM375 is therefore inhibition of

CXYorf1 (Accession XM\_088704). Accordingly, utilities of VGAM375 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXYorf1. DKFZP434L0718 (Accession NM\_032139) is another VGAM375 host target gene. DKFZP434L0718 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434L0718, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434L0718 BINDING SITE, designated SEQ ID:25820, to the nucleotide sequence of VGAM375 RNA, herein designated VGAM RNA, also designated SEQ ID:3086.

[18735] Another function of VGAM375 is therefore inhibition of DKFZP434L0718 (Accession NM\_032139). Accordingly, utilities of VGAM375 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434L0718. FLJ21302 (Accession NM\_022901) is another VGAM375 host target gene. FLJ21302 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21302, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21302 BINDING SITE, designated SEQ ID:23183, to the nucleotide sequence of VGAM375 RNA, herein designated VGAM RNA, also designated SEQ ID:3086.

[18736] Another function of VGAM375 is therefore inhibition of FLJ21302 (Accession NM\_022901). Accordingly, utilities of VGAM375 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21302. LOC200093 (Accession XM\_032184) is another VGAM375 host target gene. LOC200093 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200093, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200093 BINDING SITE, designated SEQ ID:31600, to the nucleotide sequence of VGAM375 RNA, herein designated VGAM RNA, also designated SEQ ID:3086.

[18737] Another function of VGAM375 is therefore inhibition of LOC200093 (Accession XM\_032184). Accordingly, utilities of VGAM375 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC200093. LOC91040 (Accession XM\_035641) is another VGAM375 host target gene. LOC91040 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91040 BINDING SITE, designated SEQ ID:32317, to the nucleotide sequence of VGAM375 RNA, herein designated VGAM RNA, also designated SEQ ID:3086.

[18738] Another function of VGAM375 is therefore inhibition of LOC91040 (Accession XM\_035641). Accordingly, utilities of VGAM375 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91040. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 376 (VGAM376) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18739] VGAM376 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM376 was detected is described hereinabove with reference to Figs. 1–8.

[18740] VGAM376 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Eggplant Mosaic Virus. VGAM376 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18741] VGAM376 gene encodes a VGAM376 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM376 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM376 precursor RNA is designated SEQ ID:362, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:362 is located at position 1184 relative to the genome of Eggplant Mosaic Virus.

[18742] VGAM376 precursor RNA folds onto itself, forming VGAM376 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18743] An enzyme complex designated DICER COMPLEX, `dices` the VGAM376 folded precursor RNA into VGAM376 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM376 RNA is designated SEQ ID:3087, and is provided hereinbelow with reference to the sequence listing part.

[18744] VGAM376 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM376 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM376 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18745] VGAM376 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM376 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM376 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM376 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM376 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[18746] The complementary binding of VGAM376 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM376 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM376 host target RNA into VGAM376 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18747] It is appreciated that VGAM376 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM376 host target genes. The mRNA of each one of this plurality of VGAM376 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM376 RNA, herein designated VGAM RNA, and which when bound by VGAM376 RNA causes inhibition of translation of respective one or more VGAM376 host target proteins.

[18748] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM376 gene, herein designated VGAM GENE, on one or more VGAM376 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[18749] It is yet further appreciated that a function of VGAM376 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM376 include diagnosis, prevention and treatment of viral infection by Eggplant Mosaic Virus. Specific functions, and accordingly utilities, of VGAM376 correlate with, and may be deduced from, the identity of the host target genes which VGAM376 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18750] Nucleotide sequences of the VGAM376 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM376 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM376 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM376 are further described hereinbelow with reference to Table 1.

[18751] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM376 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM376 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18752] As mentioned hereinabove with reference to Fig. 1, a function of VGAM376 gene, herein designated VGAM is inhibition of expression of VGAM376 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM376 correlate with, and may be deduced from, the identity of the target genes which VGAM376 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18753] G Protein-coupled Receptor 48 (GPR48, Accession NM\_018490) is a VGAM376 host target gene. GPR48 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GPR48, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR48 BINDING SITE, designated SEQ ID:20550, to the nucleotide sequence of VGAM376 RNA, herein designated VGAM RNA, also designated SEQ ID:3087.

[18754] A function of VGAM376 is therefore inhibition of G Protein-coupled Receptor 48 (GPR48, Accession NM\_018490), a gene which binds to follicle-stimulating hormone and thyroid-stimulating hormone. Accordingly, utilities of VGAM376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR48. The function of GPR48 has been established by previous studies. By EST database searching with known GPCRs as queries, Hsu et al. (1998) identified ESTs encoding transmembrane domains 4 and 5 of human GPR48, which they called LGR4. By RT-PCR and repeated screening of a rat ovary cDNA library, they isolated a full-length cDNA encoding rat Lgr4. Sequence analysis predicted that the 951-amino acid rat Lgr4 protein contains a signal peptide; N- and C-flanking cysteine-rich sequences separated by 17 LRRs; 5 potential N-glycosylation sites; a transmembrane region; and a 145-residue cytoplasmic

tail with multiple phosphorylation sites and a conserved potential protein kinase A (see OMIM Ref. No. 176911) phosphorylation site. Northern blot analysis of human tissues detected a 5.5-kb LGR4 transcript in multiple steroidogenic tissues and in a number of other tissues. Functional analysis showed that expression of a chimeric receptor composed of the extracellular domain of luteinizing hormone receptor (OMIM Ref. No. 152790) with the transmembrane and cytoplasmic domains of Lgr4 resulted in binding of hCG (OMIM Ref. No. 118860) but no increase in basal production of cAMP, suggesting that LGR4 may signal through another mechanism. Loh et al. (2001) cloned human GPR48. Like rat Lgr4, the deduced human GPR48 protein has 951 amino acids and a similar structure. Northern blot analysis detected wide expression of GPR48 that was highest in pancreas. Within brain, highest expression of GPR48 was in hippocampus and amygdala. Expression of Gpr48 in mouse embryos occurred as early as embryonic day 7 and peaked at day 15.

[18755] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18756] Hsu, S. Y.; Liang, S.-G.; Hsueh, A. J. W. : Characterization

of two LGR genes homologous to gonadotropin and thyrotropin receptors with extracellular leucine-rich repeats and a G protein-coupled, seven-transmembrane region. Molec. Endocr. 12: 1830-1845, 1998. ; and

[18757] Loh, E. D.; Broussard, S. R.; Kolakowski, L. F. : Molecular characterization of a novel glycoprotein hormone G-protein-coupled receptor. Biochem. Biophys. Res. Commun. 282: 757-764, 2001.

[18758] Further studies establishing the function and utilities of GPR48 are found in John Hopkins OMIM database record ID 606666, and in cited publications numbered 6451-6453 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Mature T-cell Proliferation 1 (MTCP1, Accession NM\_014221) is another VGAM376 host target gene. MTCP1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MTCP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTCP1 BINDING SITE, designated SEQ ID:15487, to the nucleotide sequence of VGAM376 RNA, herein designated VGAM RNA, also designated SEQ ID:3087.

[18759] Another function of VGAM376 is therefore inhibition of Mature T-cell Proliferation 1 (MTCP1, Accession NM\_014221). Accordingly, utilities of VGAM376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTCP1. Nuclear Protein, Ataxia-telangiectasia Locus (NPAT, Accession XM\_040846) is another VGAM376 host target gene. NPAT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NPAT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPAT BINDING SITE, designated SEQ ID:33386, to the nucleotide sequence of VGAM376 RNA, herein designated VGAM RNA, also designated SEQ ID:3087.

[18760] Another function of VGAM376 is therefore inhibition of Nuclear Protein, Ataxia-telangiectasia Locus (NPAT, Accession XM\_040846), a gene which is expressed in all tissues. Accordingly, utilities of VGAM376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPAT. The function of NPAT has been established by previous studies. From the region of the ataxia-telangiectasia gene (ATM; 208900) on

11q22–q23, Imai et al. (1996) identified a new gene, which they designated NPAT. The gene lies only 0.5 kb from the 5–prime end of the ATM gene and is transcribed in the opposite direction as ATM. The gene encodes a 1,427–amino acid protein containing nuclear localization signals and target sites for phosphorylation by cyclin–dependent protein kinases associated with E2F (see OMIM Ref. No. 189971). NPAT has a calculated molecular mass of 154,300 Da. It is relatively serine and threonine rich. The mRNA of NPAT was detected in all human tissues examined and its genomic sequence was strongly conserved through eukaryotes, suggesting that the NPAT gene may be essential for cell maintenance, i.e., a housekeeping gene. Imai et al. (1996) proposed that the promoter region may be shared by ATM and NPAT and that each gene may influence the expression of the other. They stated that they had identified no mutations of NPAT in 8 Japanese ataxia–telangiectasia patients. Byrd et al. (1996) identified a gene, which they designated E14, as a novel open reading frame in close proximity to the 5–prime end of the ATM gene. The E14 gene is transcribed divergently from a promoter region that it shares with ATM. The authors estimated that the complete E14 gene is more than

55 kb in length. They described its exon/intron boundaries; exon 13 is 1,653 bp long and comprises over a third of the coding sequence. Byrd et al. (1996) found that the gene is ubiquitously expressed. They detected 3 mRNA species: the most abundant transcript was 6.25 kb and the less abundant transcripts were 8.8 kb and 5.3 kb. They proposed that the 2 most abundant species resulted from the use of alternative poly(A) signals. Byrd et al. (1996) reported that serine and threonine residues comprise 21% of the E14 protein. Their studies demonstrated that the E14/ATM intergenic region functions as a bidirectional promoter. From studies of 5 ataxia-telangiectasia patients, Byrd et al. (1996) obtained no evidence for mutations in the E14 coding or promoter regions.

[18761] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18762] Byrd, P. J.; Cooper, P. R.; Stankovic, T.; Kullar, H. S.; Watts, G. D. J.; Robinson, P. J.; Taylor, M. R. : A gene transcribed from the bidirectional ATM promoter coding for a serine rich protein: amino acid sequence, structure and expression studies. *Hum. Molec. Genet.* 5: 1785–1791, 1996. ; and

[18763] Imai, T.; Yamauchi, M.; Seki, N.; Sugawara, T.; Saito, T.; Matsuda, Y.; Ito, H.; Nagase, T.; Nomura, N.; Hori, T. : Identification and characterization of a new gene physically linked t.

[18764] Further studies establishing the function and utilities of NPAT are found in John Hopkins OMIM database record ID 601448, and in cited publications numbered 9637, 9638–9641, 132 and 1352 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 12 (potassium/chloride transporters), Member 7 (SLC12A7, Accession NM\_006598) is another VGAM376 host target gene. SLC12A7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC12A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC12A7 BINDING SITE, designated SEQ ID:13376, to the nucleotide sequence of VGAM376 RNA, herein designated VGAM RNA, also designated SEQ ID:3087.

[18765] Another function of VGAM376 is therefore inhibition of Solute Carrier Family 12 (potassium/chloride trans–

porters), Member 7 (SLC12A7, Accession NM\_006598), a gene which is a potassium/chloride-cotransporter. Accordingly, utilities of VGAM376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC12A7. The function of SLC12A7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200. Wingless-type MMTV Integration Site Family, Member 3A (WNT3A, Accession NM\_033131) is another VGAM376 host target gene. WNT3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WNT3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WNT3A BINDING SITE, designated SEQ ID:26975, to the nucleotide sequence of VGAM376 RNA, herein designated VGAM RNA, also designated SEQ ID:3087.

[18766] Another function of VGAM376 is therefore inhibition of Wingless-type MMTV Integration Site Family, Member 3A (WNT3A, Accession NM\_033131). Accordingly, utilities of VGAM376 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with WNT3A. Bladder Cancer Associated Protein (BLCAP, Accession NM\_006698) is another VGAM376 host target gene. BLCAP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BLCAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BLCAP BINDING SITE, designated SEQ ID:13522, to the nucleotide sequence of VGAM376 RNA, herein designated VGAM RNA, also designated SEQ ID:3087.

[18767] Another function of VGAM376 is therefore inhibition of Bladder Cancer Associated Protein (BLCAP, Accession NM\_006698). Accordingly, utilities of VGAM376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BLCAP. Calcium Binding Protein 5 (CABP5, Accession NM\_019855) is another VGAM376 host target gene. CABP5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CABP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CABP5 BINDING SITE,

designated SEQ ID:21260, to the nucleotide sequence of VGAM376 RNA, herein designated VGAM RNA, also designated SEQ ID:3087.

[18768] Another function of VGAM376 is therefore inhibition of Calcium Binding Protein 5 (CABP5, Accession NM\_019855). Accordingly, utilities of VGAM376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CABP5. FLJ12425 (Accession XM\_098290) is another VGAM376 host target gene. FLJ12425 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12425, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12425 BINDING SITE, designated SEQ ID:41564, to the nucleotide sequence of VGAM376 RNA, herein designated VGAM RNA, also designated SEQ ID:3087.

[18769] Another function of VGAM376 is therefore inhibition of FLJ12425 (Accession XM\_098290). Accordingly, utilities of VGAM376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12425. KIAA1981 (Accession XM\_114000) is another VGAM376

host target gene. KIAA1981 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1981, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1981 BINDING SITE, designated SEQ ID:42610, to the nucleotide sequence of VGAM376 RNA, herein designated VGAM RNA, also designated SEQ ID:3087.

[18770] Another function of VGAM376 is therefore inhibition of KIAA1981 (Accession XM\_114000). Accordingly, utilities of VGAM376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1981. PSR (Accession XM\_036784) is another VGAM376 host target gene. PSR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PSR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSR BINDING SITE, designated SEQ ID:32502, to the nucleotide sequence of VGAM376 RNA, herein designated VGAM RNA, also designated SEQ ID:3087.

[18771] Another function of VGAM376 is therefore inhibition of PSR (Accession XM\_036784). Accordingly, utilities of VGAM376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSR. SCYB11 (Accession XM\_113426) is another VGAM376 host target gene. SCYB11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCYB11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCYB11 BINDING SITE, designated SEQ ID:42260, to the nucleotide sequence of VGAM376 RNA, herein designated VGAM RNA, also designated SEQ ID:3087.

[18772] Another function of VGAM376 is therefore inhibition of SCYB11 (Accession XM\_113426). Accordingly, utilities of VGAM376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCYB11. SMOC2 (Accession XM\_051452) is another VGAM376 host target gene. SMOC2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SMOC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMOC2 BINDING SITE, designated SEQ ID:35836, to the nucleotide sequence of VGAM376 RNA, herein designated VGAM RNA, also designated SEQ ID:3087.

[18773] Another function of VGAM376 is therefore inhibition of SMOC2 (Accession XM\_051452). Accordingly, utilities of VGAM376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMOC2. Signal Transducer and Activator of Transcription 2, 113kDa (STAT2, Accession NM\_005419) is another VGAM376 host target gene. STAT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STAT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAT2 BINDING SITE, designated SEQ ID:11893, to the nucleotide sequence of VGAM376 RNA, herein designated VGAM RNA, also designated SEQ ID:3087.

[18774] Another function of VGAM376 is therefore inhibition of Signal Transducer and Activator of Transcription 2, 113kDa (STAT2, Accession NM\_005419). Accordingly,

utilities of VGAM376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAT2. VI (Accession NM\_013443) is another VGAM376 host target gene. VI BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VI BINDING SITE, designated SEQ ID:15109, to the nucleotide sequence of VGAM376 RNA, herein designated VGAM RNA, also designated SEQ ID:3087.

[18775] Another function of VGAM376 is therefore inhibition of VI (Accession NM\_013443). Accordingly, utilities of VGAM376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VI. Zinc Finger Protein 238 (ZNF238, Accession NM\_006352) is another VGAM376 host target gene. ZNF238 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF238, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF238

BINDING SITE, designated SEQ ID:13047, to the nucleotide sequence of VGAM376 RNA, herein designated VGAM RNA, also designated SEQ ID:3087.

[18776] Another function of VGAM376 is therefore inhibition of Zinc Finger Protein 238 (ZNF238, Accession NM\_006352). Accordingly, utilities of VGAM376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF238. LOC125228 (Accession XM\_058913) is another VGAM376 host target gene. LOC125228 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC125228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC125228 BINDING SITE, designated SEQ ID:36793, to the nucleotide sequence of VGAM376 RNA, herein designated VGAM RNA, also designated SEQ ID:3087.

[18777] Another function of VGAM376 is therefore inhibition of LOC125228 (Accession XM\_058913). Accordingly, utilities of VGAM376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC125228. LOC147671 (Accession XM\_085844) is an-

other VGAM376 host target gene. LOC147671 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147671 BINDING SITE, designated SEQ ID:38378, to the nucleotide sequence of VGAM376 RNA, herein designated VGAM RNA, also designated SEQ ID:3087.

[18778] Another function of VGAM376 is therefore inhibition of LOC147671 (Accession XM\_085844). Accordingly, utilities of VGAM376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147671. LOC158563 (Accession XM\_088606) is another VGAM376 host target gene. LOC158563 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158563, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158563 BINDING SITE, designated SEQ ID:39869, to the nucleotide sequence of VGAM376 RNA, herein designated VGAM RNA, also designated SEQ ID:3087.

[18779] Another function of VGAM376 is therefore inhibition of LOC158563 (Accession XM\_088606). Accordingly, utilities of VGAM376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158563. LOC197285 (Accession XM\_113752) is another VGAM376 host target gene. LOC197285 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197285, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197285 BINDING SITE, designated SEQ ID:42416, to the nucleotide sequence of VGAM376 RNA, herein designated VGAM RNA, also designated SEQ ID:3087.

[18780] Another function of VGAM376 is therefore inhibition of LOC197285 (Accession XM\_113752). Accordingly, utilities of VGAM376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197285. LOC221839 (Accession XM\_166506) is another VGAM376 host target gene. LOC221839 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221839, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221839 BINDING SITE, designated SEQ ID:44431, to the nucleotide sequence of VGAM376 RNA, herein designated VGAM RNA, also designated SEQ ID:3087.

[18781] Another function of VGAM376 is therefore inhibition of LOC221839 (Accession XM\_166506). Accordingly, utilities of VGAM376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221839. LOC90092 (Accession XM\_028862) is another VGAM376 host target gene. LOC90092 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90092, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90092 BINDING SITE, designated SEQ ID:30790, to the nucleotide sequence of VGAM376 RNA, herein designated VGAM RNA, also designated SEQ ID:3087.

[18782] Another function of VGAM376 is therefore inhibition of LOC90092 (Accession XM\_028862). Accordingly, utilities of VGAM376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC90092. LOC91252 (Accession XM\_037173) is another VGAM376 host target gene. LOC91252 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91252, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91252 BINDING SITE, designated SEQ ID:32555, to the nucleotide sequence of VGAM376 RNA, herein designated VGAM RNA, also designated SEQ ID:3087.

[18783] Another function of VGAM376 is therefore inhibition of LOC91252 (Accession XM\_037173). Accordingly, utilities of VGAM376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91252. LOC91960 (Accession XM\_041872) is another VGAM376 host target gene. LOC91960 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91960, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91960 BINDING SITE, designated SEQ ID:33615, to the nucleotide sequence of VGAM376 RNA, herein designated

VGAM RNA, also designated SEQ ID:3087.

[18784] Another function of VGAM376 is therefore inhibition of LOC91960 (Accession XM\_041872). Accordingly, utilities of VGAM376 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91960. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 377 (VGAM377) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18785] VGAM377 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM377 was detected is described hereinabove with reference to Figs. 1–8.

[18786] VGAM377 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Eggplant Mosaic Virus. VGAM377 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18787] VGAM377 gene encodes a VGAM377 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM377 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM377 precursor RNA is designated SEQ ID:363, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:363 is located at position 2809 relative to the genome of Eggplant Mosaic Virus.

[18788] VGAM377 precursor RNA folds onto itself, forming VGAM377 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18789] An enzyme complex designated DICER COMPLEX, `dices` the VGAM377 folded precursor RNA into VGAM377 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM377 RNA is designated SEQ ID:3088, and is provided hereinbelow with reference to the sequence listing part.

[18790] VGAM377 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM377 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM377 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18791] VGAM377 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM377 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM377 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM377 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM377 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18792] The complementary binding of VGAM377 RNA, herein designated VGAM RNA, to host target binding sites on VGAM377 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM377 host target RNA into VGAM377 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18793] It is appreciated that VGAM377 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM377 host target genes. The mRNA of

each one of this plurality of VGAM377 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM377 RNA, herein designated VGAM RNA, and which when bound by VGAM377 RNA causes inhibition of translation of respective one or more VGAM377 host target proteins.

[18794] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM377 gene, herein designated VGAM GENE, on one or more VGAM377 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[18795] It is yet further appreciated that a function of VGAM377 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM377 include diagnosis, prevention and treatment of viral infection by Eggplant Mosaic Virus. Specific functions, and accordingly utilities, of VGAM377 correlate with, and may be deduced from, the identity of the host target genes which VGAM377 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18796] Nucleotide sequences of the VGAM377 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM377 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM377 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM377 are further described hereinbelow with reference to Table 1.

[18797] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM377 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM377 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[18798] As mentioned hereinabove with reference to Fig. 1, a function of VGAM377 gene, herein designated VGAM is inhibition of expression of VGAM377 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM377 correlate with, and may be deduced from, the identity of the target genes which VGAM377 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18799] D12S2489E (Accession NM\_007360) is a VGAM377 host target gene. D12S2489E BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by D12S2489E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of D12S2489E BINDING SITE, designated SEQ ID:14291, to the nucleotide sequence of VGAM377 RNA, herein designated VGAM RNA, also designated SEQ ID:3088.

[18800] A function of VGAM377 is therefore inhibition of D12S2489E (Accession NM\_007360), a gene which interacts in the inhibition and activation of NK cells. Accord-

ingly, utilities of VGAM377 include diagnosis, prevention and treatment of diseases and clinical conditions associated with D12S2489E. The function of D12S2489E and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM156. Peroxisome Biogenesis Factor 10 (PEX10, Accession NM\_002617) is another VGAM377 host target gene. PEX10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PEX10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEX10 BINDING SITE, designated SEQ ID:8480, to the nucleotide sequence of VGAM377 RNA, herein designated VGAM RNA, also designated SEQ ID:3088.

[18801] Another function of VGAM377 is therefore inhibition of Peroxisome Biogenesis Factor 10 (PEX10, Accession NM\_002617). Accordingly, utilities of VGAM377 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEX10. Syntrophin, Beta 1 (dystrophin-associated protein A1, 59kDa, basic component 1) (SNTB1, Accession NM\_021021) is another

VGAM377 host target gene. SNTB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNTB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNTB1 BINDING SITE, designated SEQ ID:22013, to the nucleotide sequence of VGAM377 RNA, herein designated VGAM RNA, also designated SEQ ID:3088.

[18802] Another function of VGAM377 is therefore inhibition of Syntrophin, Beta 1 (dystrophin-associated protein A1, 59kDa, basic component 1) (SNTB1, Accession NM\_021021). Accordingly, utilities of VGAM377 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNTB1. Cleavage and Polyadenylation Specific Factor 2, 100kDa (CPSF2, Accession XM\_029311) is another VGAM377 host target gene. CPSF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CPSF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CPSF2 BINDING SITE, designated SEQ

ID:30861, to the nucleotide sequence of VGAM377 RNA, herein designated VGAM RNA, also designated SEQ ID:3088.

[18803] Another function of VGAM377 is therefore inhibition of Cleavage and Polyadenylation Specific Factor 2, 100kDa (CPSF2, Accession XM\_029311). Accordingly, utilities of VGAM377 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPSF2. KIAA1183 (Accession XM\_031307) is another VGAM377 host target gene. KIAA1183 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1183, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1183 BINDING SITE, designated SEQ ID:31337, to the nucleotide sequence of VGAM377 RNA, herein designated VGAM RNA, also designated SEQ ID:3088.

[18804] Another function of VGAM377 is therefore inhibition of KIAA1183 (Accession XM\_031307). Accordingly, utilities of VGAM377 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1183. Mitogen-activated Protein Kinase 6 (MAPK6,

Accession NM\_002748) is another VGAM377 host target gene. MAPK6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAPK6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK6 BINDING SITE, designated SEQ ID:8626, to the nucleotide sequence of VGAM377 RNA, herein designated VGAM RNA, also designated SEQ ID:3088.

[18805] Another function of VGAM377 is therefore inhibition of Mitogen-activated Protein Kinase 6 (MAPK6, Accession NM\_002748). Accordingly, utilities of VGAM377 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPK6. MGC21636 (Accession NM\_145032) is another VGAM377 host target gene. MGC21636 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC21636, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC21636 BINDING SITE, designated SEQ ID:29647, to the nucleotide sequence of

VGAM377 RNA, herein designated VGAM RNA, also designated SEQ ID:3088.

[18806] Another function of VGAM377 is therefore inhibition of MGC21636 (Accession NM\_145032). Accordingly, utilities of VGAM377 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC21636. POPX1 (Accession NM\_014906) is another VGAM377 host target gene. POPX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POPX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POPX1 BINDING SITE, designated SEQ ID:17119, to the nucleotide sequence of VGAM377 RNA, herein designated VGAM RNA, also designated SEQ ID:3088.

[18807] Another function of VGAM377 is therefore inhibition of POPX1 (Accession NM\_014906). Accordingly, utilities of VGAM377 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POPX1. WD Repeat Domain 9 (WDR9, Accession NM\_018963) is another VGAM377 host target gene. WDR9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by WDR9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WDR9 BINDING SITE, designated SEQ ID:21032, to the nucleotide sequence of VGAM377 RNA, herein designated VGAM RNA, also designated SEQ ID:3088.

[18808] Another function of VGAM377 is therefore inhibition of WD Repeat Domain 9 (WDR9, Accession NM\_018963). Accordingly, utilities of VGAM377 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WDR9. LOC170217 (Accession XM\_093185) is another VGAM377 host target gene. LOC170217 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC170217, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170217 BINDING SITE, designated SEQ ID:40178, to the nucleotide sequence of VGAM377 RNA, herein designated VGAM RNA, also designated SEQ ID:3088.

[18809] Another function of VGAM377 is therefore inhibition of LOC170217 (Accession XM\_093185). Accordingly, utilities

of VGAM377 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170217. LOC170218 (Accession XM\_093186) is another VGAM377 host target gene. LOC170218 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC170218, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170218 BINDING SITE, designated SEQ ID:40180, to the nucleotide sequence of VGAM377 RNA, herein designated VGAM RNA, also designated SEQ ID:3088.

[18810] Another function of VGAM377 is therefore inhibition of LOC170218 (Accession XM\_093186). Accordingly, utilities of VGAM377 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170218. LOC170372 (Accession XM\_084317) is another VGAM377 host target gene. LOC170372 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC170372, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC170372 BINDING SITE, designated SEQ ID:37539, to the nucleotide sequence of VGAM377 RNA, herein designated VGAM RNA, also designated SEQ ID:3088.

[18811] Another function of VGAM377 is therefore inhibition of LOC170372 (Accession XM\_084317). Accordingly, utilities of VGAM377 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC170372. LOC219914 (Accession XM\_167788) is another VGAM377 host target gene. LOC219914 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219914, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219914 BINDING SITE, designated SEQ ID:44814, to the nucleotide sequence of VGAM377 RNA, herein designated VGAM RNA, also designated SEQ ID:3088.

[18812] Another function of VGAM377 is therefore inhibition of LOC219914 (Accession XM\_167788). Accordingly, utilities of VGAM377 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219914. LOC91750 (Accession XM\_040376) is another VGAM377 host target gene. LOC91750 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91750, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91750 BINDING SITE, designated SEQ ID:33288, to the nucleotide sequence of VGAM377 RNA, herein designated VGAM RNA, also designated SEQ ID:3088.

[18813] Another function of VGAM377 is therefore inhibition of LOC91750 (Accession XM\_040376). Accordingly, utilities of VGAM377 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91750. LOC92096 (Accession XM\_042812) is another VGAM377 host target gene. LOC92096 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92096, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92096 BINDING SITE, designated SEQ ID:33775, to the nucleotide sequence of VGAM377 RNA, herein designated VGAM RNA, also designated SEQ ID:3088.

[18814] Another function of VGAM377 is therefore inhibition of

LOC92096 (Accession XM\_042812). Accordingly, utilities of VGAM377 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92096. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 378 (VGAM378) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18815] VGAM378 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM378 was detected is described hereinabove with reference to Figs. 1–8.

[18816] VGAM378 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Feline Immunodeficiency Virus. VGAM378 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18817] VGAM378 gene encodes a VGAM378 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM378 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM378 precursor RNA is designated SEQ ID:364, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:364 is located at position 7329 relative to the genome of Feline Immunodeficiency Virus.

[18818] VGAM378 precursor RNA folds onto itself, forming VGAM378 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18819] An enzyme complex designated DICER COMPLEX, `dices` the VGAM378 folded precursor RNA into VGAM378 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide se-

quence of VGAM378 RNA is designated SEQ ID:3089, and is provided hereinbelow with reference to the sequence listing part.

[18820] VGAM378 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM378 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM378 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18821] VGAM378 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM378 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM378 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM378 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM378 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[18822] The complementary binding of VGAM378 RNA, herein designated VGAM RNA, to host target binding sites on VGAM378 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM378 host target RNA into VGAM378 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18823] It is appreciated that VGAM378 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM378 host target genes. The mRNA of each one of this plurality of VGAM378 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM378 RNA, herein designated VGAM RNA, and which when bound by VGAM378 RNA causes inhibition of translation of respective one or more VGAM378 host target proteins.

[18824] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM378 gene, herein designated VGAM GENE, on one or more VGAM378 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[18825] It is yet further appreciated that a function of VGAM378 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM378 include diagnosis, prevention and treatment of viral infection by Feline Immunodeficiency Virus. Specific functions, and accordingly utilities, of VGAM378 correlate with, and may be deduced from, the identity of the host target genes which VGAM378 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18826] Nucleotide sequences of the VGAM378 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM378 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM378 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM378 are further described hereinbelow with reference to Table 1.

[18827] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM378 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM378 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18828] As mentioned hereinabove with reference to Fig. 1, a function of VGAM378 gene, herein designated VGAM is inhibition of expression of VGAM378 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM378 correlate with, and may be deduced from, the identity of the target genes which VGAM378 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18829] IMPACT (Accession NM\_018439) is a VGAM378 host target gene. IMPACT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IMPACT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IMPACT BINDING SITE, designated SEQ ID:20501, to the nucleotide sequence of VGAM378 RNA, herein designated VGAM RNA, also designated SEQ ID:3089.

[18830] A function of VGAM378 is therefore inhibition of IMPACT (Accession NM\_018439). Accordingly, utilities of VGAM378 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IMPACT. Fig. 1 further provides a conceptual description of a novel

bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 379 (VGAM379) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18831] VGAM379 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM379 was detected is described hereinabove with reference to Figs. 1–8.

[18832] VGAM379 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Feline Immunodeficiency Virus. VGAM379 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18833] VGAM379 gene encodes a VGAM379 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM379 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM379 precursor RNA is designated SEQ ID:365, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:365 is located at position 7178 relative to the genome of Feline

## Immunodeficiency Virus.

[18834] VGAM379 precursor RNA folds onto itself, forming VGAM379 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18835] An enzyme complex designated DICER COMPLEX, `dices` the VGAM379 folded precursor RNA into VGAM379 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM379 RNA is designated SEQ ID:3090, and is provided hereinbelow with reference to the sequence listing part.

[18836] VGAM379 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM379 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM379 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18837] VGAM379 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM379 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM379 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM379 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM379 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[18838] The complementary binding of VGAM379 RNA, herein designated VGAM RNA, to host target binding sites on VGAM379 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM379 host target RNA into VGAM379 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18839] It is appreciated that VGAM379 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM379 host target genes. The mRNA of each one of this plurality of VGAM379 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM379 RNA, herein designated VGAM RNA, and which when bound by VGAM379 RNA causes inhibition of translation of respective one or more VGAM379 host target proteins.

[18840] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM379 gene, herein designated VGAM GENE, on one or more VGAM379 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[18841] It is yet further appreciated that a function of VGAM379 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM379 include diagnosis, prevention and treatment of viral infection by Feline Immunodeficiency Virus. Specific functions, and accordingly utilities, of

VGAM379 correlate with, and may be deduced from, the identity of the host target genes which VGAM379 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18842] Nucleotide sequences of the VGAM379 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM379 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM379 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM379 are further described hereinbelow with reference to Table 1.

[18843] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM379 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM379 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18844] As mentioned hereinabove with reference to Fig. 1, a function of VGAM379 gene, herein designated VGAM is inhibition of expression of VGAM379 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM379 correlate with, and may be deduced

from, the identity of the target genes which VGAM379 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18845] Guanylate Cyclase 1, Soluble, Beta 2 (GUCY1B2, Accession NM\_004129) is a VGAM379 host target gene. GUCY1B2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GUCY1B2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GUCY1B2 BINDING SITE, designated SEQ ID:10335, to the nucleotide sequence of VGAM379 RNA, herein designated VGAM RNA, also designated SEQ ID:3090.

[18846] A function of VGAM379 is therefore inhibition of Guanylate Cyclase 1, Soluble, Beta 2 (GUCY1B2, Accession NM\_004129), a gene which is beta 2 subunit of soluble guanylate cyclase which converts GTP into the second messenger cGMP and plays a major role in the cardiovascular system as a receptor for nitric oxide. Accordingly, utilities of VGAM379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GUCY1B2. The function of GUCY1B2 has been estab-

lished by previous studies. Nitric oxide-sensitive guanylyl cyclase (EC 4.6.1.2) is a heterodimeric enzyme consisting of an alpha and a beta subunit. The enzyme converts GTP into the second messenger cGMP and plays a major role in the cardiovascular system as a receptor for nitric oxide. Yuen et al. (1990) isolated rat cDNAs encoding a guanylyl cyclase beta-subunit that they designated GCS-beta-2. The predicted 682-amino acid rat protein shares 27% identity with rat GCS-beta-1 (GUCY1B3; 139397). Unlike other guanylyl cyclases, GCS-beta-2 contains an 86-amino acid C-terminal extension with a consensus sequence for isoprenylation/carboxymethylation. Northern blot analysis indicated that GCS-beta-2 is expressed at higher levels in rat kidney and liver, whereas GCS-beta-1 is preferentially expressed in lung and brain. By PCR with primers based on the sequence of rat GCS-beta-2, Behrends et al. (1999) isolated a partial human heart GUCY1B2 cDNA. By fluorescence in situ hybridization and by linkage, Behrends et al. (1999) mapped the GUCY1B2 gene to 13q14.3. By in situ hybridization, Malterer et al. (1999) confirmed the assignment of the GUCY1B2 gene to 13q14.2-q14.3.

[18847] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [18848] Yuen, P. S. T.; Potter, L. R.; Garbers, D. L. : A new form of guanylyl cyclase is preferentially expressed in rat kidney. *Biochemistry* 29: 10872–10878, 1990. ; and
- [18849] Behrends, S.; Kazmierczak, B.; Steenpass, A.; Knauf, B.; Bullerdiek, J.; Scholz, H.; Eiberg, H. : Assignment of GUCY1B2, the gene coding for the beta-2 subunit of human guanylyl cyclase.
- [18850] Further studies establishing the function and utilities of GUCY1B2 are found in John Hopkins OMIM database record ID 603695, and in cited publications numbered 4954–4956 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Myotubularin Related Protein 8 (MTMR8, Accession NM\_015458) is another VGAM379 host target gene. MTMR8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MTMR8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTMR8 BINDING SITE, designated SEQ ID:17744, to the nucleotide sequence of VGAM379 RNA,

herein designated VGAM RNA, also designated SEQ ID:3090.

[18851] Another function of VGAM379 is therefore inhibition of Myotubularin Related Protein 8 (MTMR8, Accession NM\_015458), a gene which could be a tyrosine-phosphatase. Accordingly, utilities of VGAM379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTMR8. The function of MTMR8 has been established by previous studies. MTMR8 encodes a myotubularin-related protein that, unlike most other members of the myotubularin-related protein family, has no dual-specificity phosphatase domain.

[18852] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18853] Appel, S.; Filter, M.; Reis, A.; Hennies, H. C.; Bergheim, A.; Ogilvie, E.; Arndt, S.; Simmons, A.; Lovett, M.; Hide, W.; Ramsay, M.; Reichwald, K.; Zimmermann, W.; Rosenthal, A. : Physical and transcriptional map of the critical region for keratolytic winter erythema (KWE) on chromosome 8p22-p23 between D8S550 and D8S1759. *Europ. J. Hum. Genet.* 10: 17-25, 2002. ; and

[18854] Appel, S.; Reichwald, K.; Zimmermann, W.; Reis, A.;

Rosenthal, A.; Hennies, H. C. : Identification and localization of a new human myotubularin-related protein gene, MTMR8, on 8p22-p23.

[18855] Further studies establishing the function and utilities of MTMR8 are found in John Hopkins OMIM database record ID 606260, and in cited publications numbered 11474-90 and 1264 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. 5-methyltetrahydrofolate-homocysteine Methyltransferase (MTR, Accession NM\_000254) is another VGAM379 host target gene. MTR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MTR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTR BINDING SITE, designated SEQ ID:5797, to the nucleotide sequence of VGAM379 RNA, herein designated VGAM RNA, also designated SEQ ID:3090.

[18856] Another function of VGAM379 is therefore inhibition of 5-methyltetrahydrofolate-homocysteine Methyltransferase (MTR, Accession NM\_000254). Accordingly, utilities of VGAM379 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with MTR. RNTRE (Accession NM\_014688) is another VGAM379 host target gene. RNTRE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNTRE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNTRE BINDING SITE, designated SEQ ID:16190, to the nucleotide sequence of VGAM379 RNA, herein designated VGAM RNA, also designated SEQ ID:3090.

[18857] Another function of VGAM379 is therefore inhibition of RNTRE (Accession NM\_014688), a gene which may be involved in cell proliferation. Accordingly, utilities of VGAM379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNTRE. The function of RNTRE has been established by previous studies. Matoskova et al. (1996) demonstrated that the product of the RNTRE gene is a 97- to 100-kD protein that stably associates in vivo and in vitro with EPS8 via the SH3 domain of the latter. In vitro, RNTRE displayed remarkable preference for binding to the SH3 domain of EPS8, compared with 8 other SH3s. A C-terminal trun-

cated mutant of RNTRE was able to confer proliferative advantage and reduced serum requirement to NIH3T3 fibroblasts, suggesting a role for RNTRE in cell proliferation. Epidermal growth factor receptor (EGFR; 131550) signaling involves small GTPases of the Rho family, and EGFR trafficking involves small GTPases of the Rab family. Lanzetti et al. (2000) reported that the EPS8 protein connects these signaling pathways. EPS8 is a substrate of EGFR that is held in a complex with SOS1 (OMIM Ref. No. 182530) by the adaptor protein E3B1 (OMIM Ref. No. 603050), thereby mediating activation of RAC (OMIM Ref. No. 602048). Through its SH3 domain, EPS8 interacts with RNTRE. Lanzetti et al. (2000) showed that RNTRE is a RAB5 (OMIM Ref. No. 179512) GTPase-activating protein (GAP) whose activity is regulated by EGFR. By entering in a complex with EPS8, RNTRE acts on RAB5 and inhibits internalization of the EGFR. Furthermore, RNTRE diverts EPS8 from its RAC-activating function, resulting in the attenuation of RAC signaling. Thus, depending on its state of association with E3B1 or RNTRE, EPS8 participates in both EGFR signaling through RAC and EGFR trafficking through RAB5. Lanzetti et al. (2000) showed that 2 arginine residues (arg106 and arg150 of RNTRE) are highly conserved in

TRH domains. In addition, an aspartate residue (asp147 of RNTRE) is invariant. Mutations of any of these residues to alanine resulted in proteins that were unable to display GAP activity on RAB5.

[18858] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18859] Lanzetti, L.; Rybin, V.; Malabarba, M. G.; Christoforidis, S.; Scita, G.; Zerial, M.; Di Fiore, P. P. : The Eps8 protein coordinates EGF receptor signalling through Rac and trafficking through Rab5. *Nature* 408: 374–377, 2000. ; and

[18861] Further studies establishing the function and utilities of RNTRE are found in John Hopkins OMIM database record ID 605405, and in cited publications numbered 375, 7417–741 and 8361 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RP42 (Accession NM\_020640) is another VGAM379 host target gene. RP42 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by RP42, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RP42 BINDING SITE, designated SEQ ID:21804, to the nucleotide sequence of VGAM379 RNA, herein designated VGAM RNA, also designated SEQ ID:3090.

[18862] Another function of VGAM379 is therefore inhibition of RP42 (Accession NM\_020640), a gene which not clear yet. Accordingly, utilities of VGAM379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RP42. The function of RP42 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM47. Secreted Frizzled-related Protein 1 (SFRP1, Accession NM\_003012) is another VGAM379 host target gene. SFRP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SFRP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRP1 BINDING SITE, designated SEQ ID:8933, to the nucleotide sequence of

VGAM379 RNA, herein designated VGAM RNA, also designated SEQ ID:3090.

[18863] Another function of VGAM379 is therefore inhibition of Secreted Frizzled-related Protein 1 (SFRP1, Accession NM\_003012), a gene which is a receptor for wnt proteins that may have an anti-apoptotic function. Accordingly, utilities of VGAM379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRP1. The function of SFRP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM250.Splicing Factor, Arginine/serine-rich 1 (splicing factor 2, alternate splicing factor) (SFRS1, Accession NM\_006924) is another VGAM379 host target gene. SFRS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SFRS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRS1 BINDING SITE, designated SEQ ID:13804, to the nucleotide sequence of VGAM379 RNA, herein designated VGAM RNA, also designated SEQ ID:3090.

[18864] Another function of VGAM379 is therefore inhibition of Splicing Factor, Arginine/serine-rich 1 (splicing factor 2, alternate splicing factor) (SFRS1, Accession NM\_006924), a gene which plays an essential role in pre-mRNA splicing. Accordingly, utilities of VGAM379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRS1. The function of SFRS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM323. Transcription Factor AP-2 Gamma (activating enhancer binding protein 2 gamma) (TFAP2C, Accession NM\_003222) is another VGAM379 host target gene. TFAP2C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TFAP2C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TFAP2C BINDING SITE, designated SEQ ID:9222, to the nucleotide sequence of VGAM379 RNA, herein designated VGAM RNA, also designated SEQ ID:3090.

[18865] Another function of VGAM379 is therefore inhibition of Transcription Factor AP-2 Gamma (activating enhancer

binding protein 2 gamma) (TFAP2C, Accession NM\_003222), a gene which is a sequence-specific dna-binding protein that interacts with inducible viral and cellular enhancer elements to regulate transcription of selected genes. Accordingly, utilities of VGAM379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TFAP2C. The function of TFAP2C has been established by previous studies. Families of related transcription factors are often expressed in the same cell lineages but at different times or sites in the developing embryo. The AP-2 family appears to regulate the expression of genes required for development of tissues of ectodermal origin such as neural crest and skin (Williamson et al., 1996). AP-2 may also be involved in the overexpression of c-erbB-2 (OMIM Ref. No. 164870) in human breast cancer cells (Bosher et al., 1995).

Williamson et al. (1996) isolated an AP-2-related cDNA. The predicted protein differs from AP-2-alpha (OMIM Ref. No. 107580) and -beta (OMIM Ref. No. 601601) in the N-terminal activation domain, but is 75 to 85% conserved within the DNA-binding and dimerization domains. All 3 gene products (AP-2-alpha, -beta, and -gamma) bind the GCCNNNGGC motif. Williamson et al. (1996) also obtained

a genomic clone for AP-2-gamma (designated TFAP2C). They showed it to have a similar gene structure to TFAP2A and mapped it by fluorescence in situ hybridization to 20q13.2. A mouse genomic clone was used to map the mouse Tcfap2c locus to 2H3-4.

[18866] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18867] Bosher, J. M.; Williams, T.; Hurst, H. C. : The developmentally regulated transcription factor AP-2 is involved in c-erbB-2 overexpression in human mammary carcinoma. Proc. Nat. Acad. Sci. 92: 744-747, 1995. ; and

[18868] Williamson, J. A.; Bosher, J. M.; Skinner, A.; Sheer, D.; Williams, T.; Hurst, H. C. : Chromosomal mapping of the human and mouse homologues of two new members of the AP-2 family of tra.

[18869] Further studies establishing the function and utilities of TFAP2C are found in John Hopkins OMIM database record ID 601602, and in cited publications numbered 9340 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.FLJ20054 (Accession NM\_019049) is another VGAM379 host target gene. FLJ20054 BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by FLJ20054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20054 BINDING SITE, designated SEQ ID:21130, to the nucleotide sequence of VGAM379 RNA, herein designated VGAM RNA, also designated SEQ ID:3090.

[18870] Another function of VGAM379 is therefore inhibition of FLJ20054 (Accession NM\_019049). Accordingly, utilities of VGAM379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20054. HRD1 (Accession XM\_045498) is another VGAM379 host target gene. HRD1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HRD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRD1 BINDING SITE, designated SEQ ID:34469, to the nucleotide sequence of VGAM379 RNA, herein designated VGAM RNA, also designated SEQ ID:3090.

[18871] Another function of VGAM379 is therefore inhibition of

HRD1 (Accession XM\_045498). Accordingly, utilities of VGAM379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRD1. p21(CDKN1A)-activated Kinase 7 (PAK7, Accession XM\_045653) is another VGAM379 host target gene. PAK7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PAK7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAK7 BINDING SITE, designated SEQ ID:34510, to the nucleotide sequence of VGAM379 RNA, herein designated VGAM RNA, also designated SEQ ID:3090.

[18872] Another function of VGAM379 is therefore inhibition of p21(CDKN1A)-activated Kinase 7 (PAK7, Accession XM\_045653). Accordingly, utilities of VGAM379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAK7. R3H Domain (binds single-stranded nucleic acids) Containing (R3HDM, Accession NM\_015361) is another VGAM379 host target gene. R3HDM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by R3HDM, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of R3HDM BINDING SITE, designated SEQ ID:17659, to the nucleotide sequence of VGAM379 RNA, herein designated VGAM RNA, also designated SEQ ID:3090.

[18873] Another function of VGAM379 is therefore inhibition of R3H Domain (binds single-stranded nucleic acids) Containing (R3HDM, Accession NM\_015361). Accordingly, utilities of VGAM379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with R3HDM. LOC146229 (Accession XM\_085387) is another VGAM379 host target gene. LOC146229 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146229 BINDING SITE, designated SEQ ID:38114, to the nucleotide sequence of VGAM379 RNA, herein designated VGAM RNA, also designated SEQ ID:3090.

[18874] Another function of VGAM379 is therefore inhibition of LOC146229 (Accession XM\_085387). Accordingly, utilities

of VGAM379 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146229. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 380 (VGAM380) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18875] VGAM380 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM380 was detected is described hereinabove with reference to Figs. 1–8.

[18876] VGAM380 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Feline Immunodeficiency Virus. VGAM380 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18877] VGAM380 gene encodes a VGAM380 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM380 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM380 precursor RNA is designated SEQ ID:366, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:366 is located at position 8388 relative to the genome of Feline Immunodeficiency Virus.

[18878] VGAM380 precursor RNA folds onto itself, forming VGAM380 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18879] An enzyme complex designated DICER COMPLEX, `dices` the VGAM380 folded precursor RNA into VGAM380 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM380 RNA is designated SEQ ID:3091, and

is provided hereinbelow with reference to the sequence listing part.

[18880] VGAM380 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM380 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM380 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18881] VGAM380 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM380 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM380 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM380 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM380 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18882] The complementary binding of VGAM380 RNA, herein designated VGAM RNA, to host target binding sites on VGAM380 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM380 host target RNA into VGAM380 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18883] It is appreciated that VGAM380 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM380 host target genes. The mRNA of each one of this plurality of VGAM380 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM380 RNA, herein designated VGAM RNA, and which when bound by VGAM380 RNA causes inhibition of translation of respective one or more VGAM380 host target proteins.

[18884] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM380 gene, herein designated VGAM GENE, on one or more VGAM380 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[18885] It is yet further appreciated that a function of VGAM380 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM380 include diagnosis, prevention and treatment of viral infection by Feline Immunodeficiency Virus. Specific functions, and accordingly utilities, of VGAM380 correlate with, and may be deduced from, the identity of the host target genes which VGAM380 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18886] Nucleotide sequences of the VGAM380 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM380 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM380 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM380 are further described hereinbelow with reference to Table 1.

[18887] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM380 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM380 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18888] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM380 gene, herein designated VGAM is inhibition of expression of VGAM380 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM380 correlate with, and may be deduced from, the identity of the target genes which VGAM380 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18889] Clathrin, Heavy Polypeptide (Hc) (CLTC, Accession NM\_004859) is a VGAM380 host target gene. CLTC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLTC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLTC BINDING SITE, designated SEQ ID:11268, to the nucleotide sequence of VGAM380 RNA, herein designated VGAM RNA, also designated SEQ ID:3091.

[18890] A function of VGAM380 is therefore inhibition of Clathrin, Heavy Polypeptide (Hc) (CLTC, Accession NM\_004859). Accordingly, utilities of VGAM380 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLTC. Sperm Associated Antigen 6 (SPAG6, Accession NM\_012443) is another VGAM380 host

target gene. SPAG6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPAG6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPAG6 BINDING SITE, designated SEQ ID:14818, to the nucleotide sequence of VGAM380 RNA, herein designated VGAM RNA, also designated SEQ ID:3091.

[18891] Another function of VGAM380 is therefore inhibition of Sperm Associated Antigen 6 (SPAG6, Accession NM\_012443). Accordingly, utilities of VGAM380 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPAG6. Zinc Finger Protein 144 (Mel-18) (ZNF144, Accession NM\_007144) is another VGAM380 host target gene. ZNF144 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF144, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF144 BINDING SITE, designated SEQ ID:13990, to the nucleotide sequence of VGAM380 RNA, herein designated VGAM RNA,

also designated SEQ ID:3091.

[18892] Another function of VGAM380 is therefore inhibition of Zinc Finger Protein 144 (Mel-18) (ZNF144, Accession NM\_007144), a gene which is a transcriptional repressor and may play a role in the control of cell proliferation. Accordingly, utilities of VGAM380 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF144. The function of ZNF144 has been established by previous studies. Ishida et al. (1993) isolated the human homolog of Mel18. The deduced human protein contains 344 amino acids with a RING-finger motif, a helix-loop-helix (HLH)-like structure, and a pro/ser-rich region. The MEL18 gene is conserved among vertebrates. Its mRNA is expressed at high levels in placenta, lung, and kidney, and at lower levels in liver, pancreas, and skeletal muscle

[18893] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18894] Tagawa, M.; Sakamoto, T.; Shigemoto, K.; Matsubara, H.; Tamura, Y.; Ito, T.; Nakamura, I.; Okitsu, A.; Imai, K.; Taniguchi, M. : Expression of novel DNA-binding protein with zinc finger structure in various tumor cells. J. Biol.

- [18896] Further studies establishing the function and utilities of ZNF144 are found in John Hopkins OMIM database record ID 600346, and in cited publications numbered 8284–828 and 8292 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. LOC114971 (Accession XM\_054936) is another VGAM380 host target gene. LOC114971 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC114971, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC114971 BINDING SITE, designated SEQ ID:36204, to the nucleotide sequence of VGAM380 RNA, herein designated VGAM RNA, also designated SEQ ID:3091.
- [18897] Another function of VGAM380 is therefore inhibition of LOC114971 (Accession XM\_054936). Accordingly, utilities of VGAM380 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC114971. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 381 (VGAM381) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[18898] VGAM381 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM381 was detected is described hereinabove with reference to Figs. 1–8.

[18899] VGAM381 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Feline Immunodeficiency Virus. VGAM381 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[18900] VGAM381 gene encodes a VGAM381 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM381 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM381 precursor RNA is designated SEQ

ID:367, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:367 is located at position 8564 relative to the genome of Feline Immunodeficiency Virus.

[18901] VGAM381 precursor RNA folds onto itself, forming VGAM381 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[18902] An enzyme complex designated DICER COMPLEX, `dices` the VGAM381 folded precursor RNA into VGAM381 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM381 RNA is designated SEQ ID:3092, and is provided hereinbelow with reference to the sequence

listing part.

[18903] VGAM381 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM381 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM381 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[18904] VGAM381 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM381 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM381 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM381 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM381 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[18905] The complementary binding of VGAM381 RNA, herein designated VGAM RNA, to host target binding sites on VGAM381 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM381 host target RNA into VGAM381 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[18906] It is appreciated that VGAM381 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM381 host target genes. The mRNA of each one of this plurality of VGAM381 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM381 RNA, herein designated VGAM

RNA, and which when bound by VGAM381 RNA causes inhibition of translation of respective one or more VGAM381 host target proteins.

[18907] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM381 gene, herein designated VGAM GENE, on one or more VGAM381 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[18908] It is yet further appreciated that a function of VGAM381 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM381 include diagnosis, prevention and treatment of viral infection by Feline Immunodeficiency Virus. Specific functions, and accordingly utilities, of VGAM381 correlate with, and may be deduced from, the identity of the host target genes which VGAM381 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[18909] Nucleotide sequences of the VGAM381 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM381 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM381 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM381 are further described hereinbelow with reference to Table 1.

[18910] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM381 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM381 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[18911] As mentioned hereinabove with reference to Fig. 1, a function of VGAM381 gene, herein designated VGAM is

inhibition of expression of VGAM381 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM381 correlate with, and may be deduced from, the identity of the target genes which VGAM381 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[18912] Angiotensinogen (serine (or cysteine) Proteinase Inhibitor, Clade A (alpha-1 antiproteinase, antitrypsin), Member 8) (AGT, Accession NM\_000029) is a VGAM381 host target gene. AGT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AGT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AGT BINDING SITE, designated SEQ ID:5469, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18913] A function of VGAM381 is therefore inhibition of Angiotensinogen (serine (or cysteine) Proteinase Inhibitor, Clade A (alpha-1 antiproteinase, antitrypsin), Member 8) (AGT, Accession NM\_000029). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AGT.

Asialoglycoprotein Receptor 2 (ASGR2, Accession NM\_080912) is another VGAM381 host target gene. ASGR2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ASGR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ASGR2 BINDING SITE, designated SEQ ID:28129, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18914] Another function of VGAM381 is therefore inhibition of Asialoglycoprotein Receptor 2 (ASGR2, Accession NM\_080912). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASGR2. AXIN1 Up-regulated 1 (AXUD1, Accession NM\_033027) is another VGAM381 host target gene. AXUD1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AXUD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AXUD1 BINDING SITE, des-

ignated SEQ ID:26919, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18915] Another function of VGAM381 is therefore inhibition of AXIN1 Up-regulated 1 (AXUD1, Accession NM\_033027). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AXUD1. Chromosome 20 Open Reading Frame 1 (C20orf1, Accession NM\_012112) is another VGAM381 host target gene. C20orf1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf1 BINDING SITE, designated SEQ ID:14427, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18916] Another function of VGAM381 is therefore inhibition of Chromosome 20 Open Reading Frame 1 (C20orf1, Accession NM\_012112), a gene which is a nuclear proliferation-associated protein. Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with C20orf1. The function of C20orf1 has been established by previous studies. Heidebrecht et al. (1997) determined that p100 is a nuclear proliferation-associated protein whose expression is restricted to cell cycle phases S, G2, and M. Using an mRNA differential display technique, Manda et al. (1999) isolated 2 novel cDNAs, SPON2 (OMIM Ref. No. 605918) and C20ORF1, which they designated differentially expressed in cancerous and noncancerous lung cells-1 (DIL1) and -2 (DIL2), respectively. The full-length C20ORF1 cDNA encodes a 747-amino acid protein with a putative ATP/GTP-binding site motif. RT-PCR analysis demonstrated strong expression of C20ORF1 in lung carcinoma cell lines. Northern blot analysis detected expression in fetal lung but not in adult lung. C20ORF1 expression was also found in adult placenta, skeletal muscle, thymus, testis, and small intestine and in fetal brain, liver, and kidney. By fluorescence in situ hybridization, Zhang et al. (1999) mapped the C20ORF1 gene to chromosome 20q11.2.

[18917] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18918] Manda, R.; Kohno, T.; Matsuno, Y.; Takenoshita, S.;

Kuwano, H.; Yokota, J. : Identification of genes (SPON2 and C20orf2) differentially expressed between cancerous and noncancerous lung cells by mRNA differential display. Genomics 61: 5–14, 1999. ; and

[18919] Heidebrecht, H. J.; Buck, F.; Steinmann, J.; Sprenger, R.; Wacker, H. H.; Parwaresch, R. : p100: a novel proliferation-associated nuclear protein specifically restricted to cell cycle p.

[18920] Further studies establishing the function and utilities of C20orf1 are found in John Hopkins OMIM database record ID 605917, and in cited publications numbered 97 and 6436–6437 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. CD4 Antigen (p55) (CD4, Accession NM\_000616) is another VGAM381 host target gene. CD4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD4 BINDING SITE, designated SEQ ID:6217, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18921] Another function of VGAM381 is therefore inhibition of CD4 Antigen (p55) (CD4, Accession NM\_000616), a gene which is T-cell surface glycoprotein and has role in cell-cell interactions and may act in signal transduction. Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD4. The function of CD4 has been established by previous studies. In transgenic mice carrying the human CD4 gene, Buttini et al. (1998) found that human CD4 is expressed on microglia, the resident mononuclear phagocytes of brain. Normally there is no neuronal damage. Activation of brain microglia by peripheral immune challenges elicited neurodegeneration in human CD4 mice but not in nontransgenic controls. In postmortem brain tissues from AIDS patients with opportunistic infections, but without typical HIV encephalitis, human CD4 expression correlated with neurodegeneration. Buttini et al. (1998) concluded that human CD4 may function as an important mediator of indirect neuronal damage in infectious and immune-mediated diseases of the central nervous system (CNS). The important role of human CD4 expression on microglia/macrophages creates a pathogenetic link between the immune system and the CNS.

Animal model experiments lend further support to the function of CD4. In transgenic mice carrying the human CD4 gene, Buttini et al. (1998) found that human CD4 is expressed on microglia, the resident mononuclear phagocytes of brain. Normally there is no neuronal damage. Activation of brain microglia by peripheral immune challenges elicited neurodegeneration in human CD4 mice but not in nontransgenic controls. In postmortem brain tissues from AIDS patients with opportunistic infections, but without typical HIV encephalitis, human CD4 expression correlated with neurodegeneration. Buttini et al. (1998) concluded that human CD4 may function as an important mediator of indirect neuronal damage in infectious and immune-mediated diseases of the central nervous system (CNS). The important role of human CD4 expression on microglia/macrophages creates a pathogenetic link between the immune system and the CNS.

[18922] It is appreciated that the abovementioned animal model for CD4 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[18923] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [18924] Buttini, M.; Westland, C. E.; Masliah, E.; Yafeh, A. M.; Wyss-Coray, T.; Mucke, L. : Novel role of human CD4 molecule identified in neurodegeneration. *Nature Med.* 4: 441–446, 1998. ; and

- [18926] Further studies establishing the function and utilities of CD4 are found in John Hopkins OMIM database record ID 186940, and in cited publications numbered 10551–10558, 5690, 10559–10562, 5691, 6036, 10563–10566, 983 and 10960–10031 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Early Growth Response 1 (EGR1, Accession NM\_001964) is another VGAM381 host target gene. EGR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EGR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGR1 BINDING SITE, designated SEQ ID:7691, to the nucleotide sequence of VGAM381 RNA, herein des-

ignated VGAM RNA, also designated SEQ ID:3092.

[18927] Another function of VGAM381 is therefore inhibition of Early Growth Response 1 (EGR1, Accession NM\_001964). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGR1. ELK1, Member of ETS Oncogene Family (ELK1, Accession NM\_005229) is another VGAM381 host target gene. ELK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ELK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELK1 BINDING SITE, designated SEQ ID:11728, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18928] Another function of VGAM381 is therefore inhibition of ELK1, Member of ETS Oncogene Family (ELK1, Accession NM\_005229), a gene which stimulates transcription. can form a ternary complex with the serum response factor and the ets and srf motifs of the fos serum response element. Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical con-

ditions associated with ELK1. The function of ELK1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM178.V-erb-a Erythroblastic Leukemia Viral Oncogene Homolog 4 (avian) (ERBB4, Accession NM\_005235) is another VGAM381 host target gene. ERBB4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ERBB4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ERBB4 BINDING SITE, designated SEQ ID:11744, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18929] Another function of VGAM381 is therefore inhibition of V-erb-a Erythroblastic Leukemia Viral Oncogene Homolog 4 (avian) (ERBB4, Accession NM\_005235), a gene which may function in growth/differentiation of normal and transformed cells. Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERBB4. The function of ERBB4 has been established by previous studies. The

HER4/ERBB4 gene is a member of the type I receptor tyrosine kinase subfamily that includes EGFR (OMIM Ref. No. 131550), ERBB2 (OMIM Ref. No. 164870), and ERBB3 (OMIM Ref. No. 190151). It encodes a receptor for NDF/heregulin (OMIM Ref. No. 142445). Neuregulins and their receptors, the ERBB protein tyrosine kinases, are essential for neuronal development. Huang et al. (2000) reported that ERBB4 is enriched in the postsynaptic density and associates with PSD95 (OMIM Ref. No. 602887). Heterologous expression of PSD95 enhanced NRG (OMIM Ref. No. 142445) activation of ERBB4 and MAP kinase (see OMIM Ref. No. 176948). Conversely, inhibiting expression of PSD95 in neurons attenuated NRG-mediated activation of MAP kinase. PSD95 formed a ternary complex with 2 molecules of ERBB4, suggesting that PSD95 facilitates ERBB4 dimerization. Finally, NRG suppressed induction of long-term potentiation in the hippocampal CA1 region without affecting basal synaptic transmission. Thus, NRG signaling may be synaptic and regulated by PSD95. Huang et al. (2000) concluded that a role of NRG signaling in the adult central nervous system may be modulation of synaptic plasticity. ERBB4 is a transmembrane receptor tyrosine kinase that regulates cell proliferation and differ-

entiation. After binding its ligand heregulin or activation of protein kinase C (see OMIM Ref. No. 176960) by TPA, the ERBB4 ectodomain is cleaved by a metalloprotease. Ni et al. (2001) reported a subsequent cleavage by gamma-secretase that releases the ERBB4 intracellular domain from the membrane and facilitates its translocation to the nucleus. Gamma-secretase cleavage was prevented by chemical inhibitors or a dominant-negative presenilin (OMIM Ref. No. 104311). Inhibition of gamma-secretase also prevented growth inhibition by heregulin. Ni et al. (2001) concluded that gamma-secretase cleavage of ERBB4 may represent another mechanism for receptor tyrosine kinase-mediated signaling. Using human cDNA probes in fluorescence in situ hybridization, Zimonjic et al. (1995) mapped the ERBB4 gene to 2q33.3-q34. The finding established that the ERBB4 gene, like the related EGFR, ERBB2, and ERBB3 genes, is located in close proximity to homeobox and collagen gene loci. Animal model experiments lend further support to the function of ERBB4. ErbB4  $-/-$  mouse embryos develop trigeminal ganglion and geniculate/cochleovestibular ganglia that are displaced toward each other and show axonal misprojections (Gassmann et al., 1995). Golding et al. (2000) found

that these morphologic changes correlate with aberrant migration of a subpopulation of hindbrain-derived cranial neural crest cells. The aberrant migration is also accompanied by an apparent downregulation of HoxB2 (OMIM Ref. No. 142967) gene expression.

[18930] It is appreciated that the abovementioned animal model for ERBB4 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[18931] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18932] Huang, Y. Z.; Won, S.; Ali, D. W.; Wang, Q.; Tanowitz, M.; Du, Q. S.; Pelkey, K. A.; Yang, D. J.; Xiong, W. C.; Salter, M. W.; Mei, L. : Regulation of neuregulin signaling by PSD-95 interacting with ErbB4 at CNS synapses. Neuron 26: 443-455, 2000. ; and

[18934] Further studies establishing the function and utilities of ERBB4 are found in John Hopkins OMIM database record

ID 600543, and in cited publications numbered 7868–7869, 1157 and 11576 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Growth Factor Independent 1 (GFI1, Accession NM\_005263) is another VGAM381 host target gene. GFI1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GFI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GFI1 BINDING SITE, designated SEQ ID:11769, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18935] Another function of VGAM381 is therefore inhibition of Growth Factor Independent 1 (GFI1, Accession NM\_005263). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GFI1. Guanine Nucleotide Binding Protein (G protein), Beta Polypeptide 1 (GNB1, Accession NM\_002074) is another VGAM381 host target gene. GNB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GNB1, corresponding to a HOST TARGET binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNB1 BINDING SITE, designated SEQ ID:7850, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18936] Another function of VGAM381 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Beta Polypeptide 1 (GNB1, Accession NM\_002074). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNB1. Hepatic Leukemia Factor (HLF, Accession NM\_002126) is another VGAM381 host target gene. HLF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HLF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HLF BINDING SITE, designated SEQ ID:7903, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18937] Another function of VGAM381 is therefore inhibition of Hepatic Leukemia Factor (HLF, Accession NM\_002126). Accordingly, utilities of VGAM381 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with HLF. High-mobility Group Nucleosome Binding Domain 1 (HMGN1, Accession NM\_004965) is another VGAM381 host target gene. HMGN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HMGN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMGN1 BINDING SITE, designated SEQ ID:11412, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18938] Another function of VGAM381 is therefore inhibition of High-mobility Group Nucleosome Binding Domain 1 (HMGN1, Accession NM\_004965), a gene which binds to the inner side of the nucleosomal DNA and involves in transcriptional regulation. Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMGN1. The function of HMGN1 has been established by previous studies. See 163910. Chromosomal protein HMG14 and its close analog HMG17 (OMIM Ref. No. 163910) bind to the inner side of the nucleosomal DNA, potentially altering

the interaction between the DNA and the histone octamer. The 2 proteins may be involved in the process that maintains transcribable genes in a unique chromatin conformation. Their ubiquitous distribution, relative abundance, and high evolutionary conservation of the DNA-binding domain of the HMG-14 family of proteins, suggest that they may be involved in an important cellular function. The human HMG14 multigene family is 1 of the largest retropseudogene families known. However, Landsman et al. (1989) found only a single genomic clone selected with a cDNA, thus suggesting that the human genome contains few and perhaps only 1 functional gene. The gene was found to comprise 6 exons ranging in size from 30 to 839 bp, 2 of which code for the entire DNA binding site of the protein and have several features typical of 'housekeeping' genes. Using human-rodent somatic cell hybrids, Landsman et al. (1989) localized the HMG14 gene to human chromosome 21. They detected a RFLP useful for further analysis and mapping. Comparison with the human and chicken HMG17 genes showed that all contain 6 exons; all have exons of similar size; all have 5-prime regions highly enriched in GC residues; and all have features typical of housekeeping genes. Petersen et al. (1990) used a GT

dinucleotide repeat as a polymorphic marker in linkage analysis to demonstrate that the HMG14 locus is close to the ETS2 gene in band 21q22.3. By in situ hybridization, Pash et al. (1990) confirmed the assignment to 21q22.3. Furthermore, they analyzed the expression of the HMG14 gene in mouse embryos trisomic for chromosome 16 and found that trisomy 16 embryos had approximately 1.5 times more HMG14 mRNA and protein than their normal littermates. Pash et al. (1990) suggested that this nucleosomal binding protein may confer distinct properties to the chromatin structure of transcriptionally active genes and therefore may be a contributing factor in the development of Down syndrome. Since HMG14 is preferentially associated with transcriptionally active chromatin, Ding et al. (1994) assessed its effect on transcription by RNA polymerase II. They found that HMG14 enhanced transcription on chromatin templates but not on DNA templates. These findings suggested that the association of HMG14 with nucleosomes is part of the cellular process involved in the generation of transcriptionally active chromatin.

[18939] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

[18940] Ding, H.-F.; Rimsky, S.; Batson, S. C.; Bustin, M.; Hansen, U. : Stimulation of RNA polymerase II elongation by chromosomal protein HMG-14. Science 265: 796-799, 1994. ; and

[18941] Landsman, D.; McBride, O. W.; Soares, N.; Crippa, M. P.; Srikantha, T.; Bustin, M. : Chromosomal protein HMG-14: identification, characterization, and chromosome localization of a function.

[18942] Further studies establishing the function and utilities of HMGN1 are found in John Hopkins OMIM database record ID 163920, and in cited publications numbered 3019-3022 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Hormonally Upregulated Neu-associated Kinase (HUNK, Accession NM\_014586) is another VGAM381 host target gene. HUNK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HUNK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HUNK BINDING SITE, designated SEQ ID:15948, to the nucleotide sequence of VGAM381 RNA,

herein designated VGAM RNA, also designated SEQ ID:3092.

[18943] Another function of VGAM381 is therefore inhibition of Hormonally Upregulated Neu-associated Kinase (HUNK, Accession NM\_014586). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HUNK. Myosin IC (MYO1C, Accession XM\_028385) is another VGAM381 host target gene. MYO1C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYO1C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYO1C BINDING SITE, designated SEQ ID:30696, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18944] Another function of VGAM381 is therefore inhibition of Myosin IC (MYO1C, Accession XM\_028385), a gene which participates in adaptation in hair cells. Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYO1C. The function of MYO1C has been established by

previous studies. MYO1C, also known as myosin I-beta and MYR2, was thought to mediate the slow component of adaptation by hair cells, the sensory cells of the inner ear. To test this hypothesis, Holt et al. (2002) mutated tyr61 of MYO1C to gly, conferring susceptibility to inhibition by N6-modified ADP analogs. They expressed the mutant MYO1C in utricular hair cells of transgenic mice, delivered an ADP analog through a whole-cell recording pipette, and found that the analog rapidly blocked adaptation to positive and negative deflections in transgenic cells but not in wildtype cells. The speed and specificity of inhibition suggested that MYO1C participates in adaptation in hair cells.

[18945] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18946] Crozet, F.; Amraoui, A. E.; Blanchard, S.; Lenoir, M.; Ripoll, C.; Vago, P.; Hamel, C.; Fizames, C.; Levi-Acobas, F.; Depetris, D.; Mattei, M.-G.; Weil, D.; Pujol, R.; Petit, C. : Cloning of the genes encoding two murine and human cochlear unconventional type I myosins. *Genomics* 40: 332-341, 1997. ; and

[18947] Holt, J. R.; Gillespie, S. K. H.; Provance, D. W., Jr.; Shah, K.;

Shokat, K. M.; Corey, D. P.; Mercer, J. A.; Gillespie, P. G. : A chemical-genetic strategy implicates myosin-1c in adap.

[18948] Further studies establishing the function and utilities of MYO1C are found in John Hopkins OMIM database record ID 606538, and in cited publications numbered 6515 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Paired Mesoderm Homeo Box 1 (PMX1, Accession NM\_022716) is another VGAM381 host target gene. PMX1 BINDING SITE1 and PMX1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PMX1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PMX1 BINDING SITE1 and PMX1 BINDING SITE2, designated SEQ ID:22914 and SEQ ID:13779 respectively, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18949] Another function of VGAM381 is therefore inhibition of Paired Mesoderm Homeo Box 1 (PMX1, Accession NM\_022716), a gene which acts as a transcriptional regulator of muscle creatine kinase. Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with PMX1. The function of PMX1 has been established by previous studies. Homeo box genes are expressed in specific temporal and spatial patterns and function as transcriptional regulators of developmental processes. The murine homeo box gene Pmx (paired mesoderm homeo box), previously called K-2 and mHox, is expressed in a mesodermally restricted pattern in embryos and most abundantly in cardiac, skeletal, and smooth muscle tissues in adults (Kern et al., 1994). Grueneberg et al. (1992) cloned the homologous human gene. By means of interspecific backcross analysis, Kern et al. (1994) determined that the Pmx gene is located on mouse chromosome 1, approximately 3.3 cM distal to the Gsh-4 homeo box locus. The gene contains at least 5 exons spanning a minimum of 60 kb of genomic DNA, making this the largest known murine homeo box gene. The homologous human gene may map to 1q inasmuch as this region is syntenic with the region of mouse chromosome 1 where Pmx is located. Norris et al. (2000) mapped the human PRRX1 gene to 1q23 by fluorescence in situ hybridization.

[18950] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [18951] Grueneberg, D. A.; Natesan, S.; Alexandre, C.; Gilman, M. Z. : Human and Drosophila homeodomain proteins that enhance the DNA-binding activity of serum response factor. Science 257: 1089–1095, 1992. ; and
- [18952] Norris, R. A.; Scott, K. K.; Moore, C. S.; Stetten, G.; Brown, C. R.; Jabs, E. W.; Wulfsberg, E. A.; Yu, J.; Kern, M. J. : Human PRRX1 and PRRX2 genes: cloning, expression, genomic localiz.
- [18953] Further studies establishing the function and utilities of PMX1 are found in John Hopkins OMIM database record ID 167420, and in cited publications numbered 10955–10959 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily D, Member 1 (SMARCD1, Accession NM\_139071) is another VGAM381 host target gene. SMARCD1 BINDING SITE1 and SMARCD1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SMARCD1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of SMARCD1 BINDING SITE1 and SMARCD1 BINDING SITE2, designated SEQ ID:29142 and SEQ ID:9044 respectively, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18954] Another function of VGAM381 is therefore inhibition of SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily D, Member 1 (SMARCD1, Accession NM\_139071), a gene which is involved in chromatin assembly and remodeling. Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMARCD1. The function of SMARCD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152. Ubiquitin-conjugating Enzyme E2L 3 (UBE2L3, Accession NM\_003347) is another VGAM381 host target gene. UBE2L3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBE2L3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE2L3 BINDING SITE, designated SEQ

ID:9359, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18955] Another function of VGAM381 is therefore inhibition of Ubiquitin-conjugating Enzyme E2L 3 (UBE2L3, Accession NM\_003347), a gene which catalyzes the covalent attachment of ubiquitin to other proteins. Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE2L3. The function of UBE2L3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM215. Wingless-type MMTV Integration Site Family, Member 1 (WNT1, Accession NM\_005430) is another VGAM381 host target gene. WNT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WNT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WNT1 BINDING SITE, designated SEQ ID:11896, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18956] Another function of VGAM381 is therefore inhibition of Wingless-type MMTV Integration Site Family, Member 1 (WNT1, Accession NM\_005430), a gene which may have a role in development of the central nervous system. Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WNT1. The function of WNT1 has been established by previous studies. Int oncogenes, including Int1, were first identified as targets for insertional activation by the mouse mammary tumor virus (MMTV) in mammary carcinomas. Int2 (see OMIM Ref. No. 164950) and Int3 (see OMIM Ref. No. 164951) are fundamentally unrelated genes; the similarity in nomenclature is based on the criterion of being a target for MMTV insertion mutation. Nusse et al. (1991) proposed that the INT1 gene be termed WNT1 (pronounced 'wint 1'), because it was both an INT gene and a homolog of the *Drosophila* 'wingless' gene. The WNTs are a family of secreted glycoproteins that have been shown to be involved in a variety of developmental processes in many organisms. The prototype of the family is the *Drosophila* protein 'wingless' which acts as a segment polarity gene during embryogenesis and later participates in pattern formation of other body parts.

Gavin et al. (1990) isolated 7 murine Wnt family members; Wolda and Moon (1992) isolated 7 *Xenopus* Wnt family members. McMahon (1992) discussed the Wnt family of developmental regulators, with particular reference to mouse mammary gland and the development of mouse mammary tumors. INT1 has a highly specific (both temporal and spatial) pattern of expression in fetal brain and spinal cord from 9- to 10-day-old mouse embryos but has been demonstrated to be expressed in only 1 adult tissue, postmyotic spermatids. The *Drosophila* homolog of INT1 is 'wingless,' a segment-polarity gene. Indirect evidence that INT1 is secreted and that the product of 'wingless' is a diffusible gene product suggests that these proteins are secreted growth factors. By analyzing human genome draft sequence, Kirikoshi et al. (2001) determined that WNT1 is encoded by 4 exons and is clustered with WNT10B (OMIM Ref. No. 601906) in a head-to-head manner within an interval of less than 7 kb. They discussed possibilities for the origin of WNT gene clusters through duplication of an ancestral WNT gene cluster. Animal model experiments lend further support to the function of WNT1. Tsukamoto et al. (1988) generated transgenic mice ectopically expressing Wnt1 RNA at high levels in mam-

mary and salivary glands of male and female mice and in male reproductive organs. The mammary glands of males and virgin females were grossly hyperplastic compared with those of nontransgenic littermates. Tsukamoto et al. (1988) observed mammary and (less frequently) salivary adenocarcinomas in these animals at rates indicating that transcriptional activation of Wnt1 and associated hyperplasia are initiating events in multistep carcinogenesis. Thomas and Capecchi (1990) explored the function of int1 in the mouse by disrupting one of the 2 int1 alleles in mouse embryo-derived stem cells using positive-negative selection. This cell line was then used to generate a chimeric mouse that transmitted the mutant allele to its progeny. Mice heterozygous for the null mutation were normal and fertile, whereas mice homozygous for the mutation exhibited a range of phenotypes from death before birth to survival with severe ataxia. Examination of homozygous mice at several stages of embryogenesis showed severe abnormalities in the development of the mesencephalon and metencephalon, indicating a prominent role for the int1 protein in the induction of the mesencephalon and cerebellum.

[18957] It is appreciated that the abovementioned animal model

for WNT1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[18958] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18959] Kirikoshi, H.; Sekihara, H.; Katoh, M. : WNT10A and WNT6, clustered in human chromosome 2q35 region with head-to-tail manner, are strongly coexpressed in SW480 cells. Biochem. Biophys. Res. Commun. 283: 798–805, 2001. ; and

[18960] Wolda, S. L.; Moon, R. T. : Cloning and developmental expression in *Xenopus laevis* of seven additional members of the Wnt family. Oncogene 7: 1941–1947, 1992.

[18961] Further studies establishing the function and utilities of WNT1 are found in John Hopkins OMIM database record ID 164820, and in cited publications numbered 12746–12753, 882, 1724, 3475–172 and 3972 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zic Family Member 1 (odd-paired homolog, *Drosophila*) (ZIC1, Accession NM\_003412) is another VGAM381 host target gene. ZIC1 BINDING SITE is HOST TARGET binding site found in the

5' untranslated region of mRNA encoded by ZIC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZIC1 BINDING SITE, designated SEQ ID:9447, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18962] Another function of VGAM381 is therefore inhibition of Zic Family Member 1 (odd-paired homolog, *Drosophila*) (ZIC1, Accession NM\_003412), a gene which may play a role in cerebellar development. Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZIC1. The function of ZIC1 has been established by previous studies. mouse cerebellum and is highly homologous to the *Drosophila* pair-rule gene Opa. To clarify the mechanism for the development of the human cerebellum and the possible involvement of ZIC in human nervous system diseases, Yokota et al. (1996) isolated human ZIC cDNA and examined its expression by using monoclonal antibody against recombinant ZIC protein. The nucleotide sequence of human ZIC cDNA is 85% homologous to that the mouse zic gene. Its putative amino acid sequence is highly conserved

(more than 99%) except for substitution of only 2 amino acid residues. By fluorescence in situ hybridization, Yokota et al. (1996) mapped the human ZIC gene to 3q24. The human ZIC protein was immunohistochemically detected in the nuclei of the cerebellar granule cell lineage from the progenitor cells of the external germinal layer to the postmigrated cells of the internal granular layer. Furthermore, ZIC protein was detected in medulloblastoma (26 of 29 cases), whereas none of 70 other tumors examined, including primitive neuroectodermal tumors, expressed this protein. These findings suggested that ZIC is a potential biomarker for medulloblastoma as well as the human cerebellar granule cell lineage.

[18963] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[18964] Aruga, J.; Yokota, N.; Hashimoto, M.; Furuichi, T.; Fukuda, M.; Mikoshiba, K. : A novel zinc finger protein, Zic, is involved in neurogenesis, especially in the cell lineage of cerebellar granule cells. *J. Neurochem.* 63: 1880–1890, 1994. ; and

[18965] Yokota, N.; Aruga, J.; Takai, S.; Yamada, K.; Hamazaki, M.; Iwase, T.; Sugimura, H.; Mikoshiba, K. : Predominant ex–

pression of human Zic in cerebellar granule cell lineage and medulloblasto.

[18966] Further studies establishing the function and utilities of ZIC1 are found in John Hopkins OMIM database record ID 600470, and in cited publications numbered 7734–7736 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZp547G183 (Accession NM\_018705) is another VGAM381 host target gene. DKFZp547G183 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp547G183, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547G183 BINDING SITE, designated SEQ ID:20788, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18967] Another function of VGAM381 is therefore inhibition of DKFZp547G183 (Accession NM\_018705). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547G183. FLJ12783 (Accession NM\_031426) is another VGAM381 host target gene. FLJ12783 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12783, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12783 BINDING SITE, designated SEQ ID:25416, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18968] Another function of VGAM381 is therefore inhibition of FLJ12783 (Accession NM\_031426). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12783. FLJ13102 (Accession NM\_024887) is another VGAM381 host target gene. FLJ13102 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13102, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13102 BINDING SITE, designated SEQ ID:24342, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18969] Another function of VGAM381 is therefore inhibition of

FLJ13102 (Accession NM\_024887). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13102. FLJ13848 (Accession NM\_024771) is another VGAM381 host target gene. FLJ13848 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13848, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13848 BINDING SITE, designated SEQ ID:24133, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18970] Another function of VGAM381 is therefore inhibition of FLJ13848 (Accession NM\_024771). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13848. FLJ13993 (Accession XM\_017638) is another VGAM381 host target gene. FLJ13993 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13993, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ13993 BINDING SITE, designated SEQ ID:30328, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18971] Another function of VGAM381 is therefore inhibition of FLJ13993 (Accession XM\_017638). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13993. FLJ22944 (Accession NM\_025145) is another VGAM381 host target gene. FLJ22944 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22944, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22944 BINDING SITE, designated SEQ ID:24785, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18972] Another function of VGAM381 is therefore inhibition of FLJ22944 (Accession NM\_025145). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22944. FLJ32334 (Accession NM\_144565) is another VGAM381

host target gene. FLJ32334 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ32334, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32334 BINDING SITE, designated SEQ ID:29370, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18973] Another function of VGAM381 is therefore inhibition of FLJ32334 (Accession NM\_144565). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32334. GTP Binding Protein 2 (GTPBP2, Accession NM\_019096) is another VGAM381 host target gene. GTPBP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GTPBP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GTPBP2 BINDING SITE, designated SEQ ID:21172, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18974] Another function of VGAM381 is therefore inhibition of GTP Binding Protein 2 (GTPBP2, Accession NM\_019096). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTPBP2. HSPC065 (Accession NM\_014157) is another VGAM381 host target gene. HSPC065 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HSPC065, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC065 BINDING SITE, designated SEQ ID:15449, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18975] Another function of VGAM381 is therefore inhibition of HSPC065 (Accession NM\_014157). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC065. IMPACT (Accession NM\_018439) is another VGAM381 host target gene. IMPACT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IMPACT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IMPACT BINDING SITE, designated SEQ ID:20502, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18976] Another function of VGAM381 is therefore inhibition of IMPACT (Accession NM\_018439). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IMPACT. KIAA0258 (Accession NM\_014785) is another VGAM381 host target gene. KIAA0258 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0258, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0258 BINDING SITE, designated SEQ ID:16643, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18977] Another function of VGAM381 is therefore inhibition of KIAA0258 (Accession NM\_014785). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0258. KIAA0853 (Accession NM\_015070) is another VGAM381 host target gene. KIAA0853 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0853, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0853 BINDING SITE, designated SEQ ID:17436, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18978] Another function of VGAM381 is therefore inhibition of KIAA0853 (Accession NM\_015070). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0853. KIAA1111 (Accession XM\_171233) is another VGAM381 host target gene. KIAA1111 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1111, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1111 BINDING SITE, designated SEQ ID:46019, to the nucleotide sequence of VGAM381 RNA, herein designated

VGAM RNA, also designated SEQ ID:3092.

[18979] Another function of VGAM381 is therefore inhibition of KIAA1111 (Accession XM\_171233). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1111. KIAA1854 (Accession XM\_049884) is another VGAM381 host target gene. KIAA1854 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1854, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1854 BINDING SITE, designated SEQ ID:35521, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18980] Another function of VGAM381 is therefore inhibition of KIAA1854 (Accession XM\_049884). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1854. KIAA1887 (Accession XM\_084801) is another VGAM381 host target gene. KIAA1887 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1887, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1887 BINDING SITE, designated SEQ ID:37714, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18981] Another function of VGAM381 is therefore inhibition of KIAA1887 (Accession XM\_084801). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1887. MGC17330 (Accession NM\_052880) is another VGAM381 host target gene. MGC17330 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC17330, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC17330 BINDING SITE, designated SEQ ID:27460, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18982] Another function of VGAM381 is therefore inhibition of MGC17330 (Accession NM\_052880). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with MGC17330. MGC2541 (Accession NM\_080670) is another VGAM381 host target gene. MGC2541 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2541, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2541 BINDING SITE, designated SEQ ID:27965, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18983] Another function of VGAM381 is therefore inhibition of MGC2541 (Accession NM\_080670). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2541. P66 (Accession NM\_020699) is another VGAM381 host target gene. P66 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P66, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P66 BINDING SITE, designated SEQ ID:21842, to the nucleotide sequence of

VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18984] Another function of VGAM381 is therefore inhibition of P66 (Accession NM\_020699). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P66. Serine/threonine Kinase 38 Like (STK38L, Accession XM\_044823) is another VGAM381 host target gene. STK38L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STK38L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK38L BINDING SITE, designated SEQ ID:34288, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18985] Another function of VGAM381 is therefore inhibition of Serine/threonine Kinase 38 Like (STK38L, Accession XM\_044823). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK38L. LOC112868 (Accession XM\_053402) is another VGAM381 host target

gene. LOC112868 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC112868, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC112868 BINDING SITE, designated SEQ ID:36076, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18986] Another function of VGAM381 is therefore inhibition of LOC112868 (Accession XM\_053402). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC112868. LOC126528 (Accession XM\_059052) is another VGAM381 host target gene. LOC126528 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC126528, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126528 BINDING SITE, designated SEQ ID:36845, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18987] Another function of VGAM381 is therefore inhibition of LOC126528 (Accession XM\_059052). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126528. LOC126661 (Accession XM\_059061) is another VGAM381 host target gene. LOC126661 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC126661, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126661 BINDING SITE, designated SEQ ID:36849, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18988] Another function of VGAM381 is therefore inhibition of LOC126661 (Accession XM\_059061). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126661. LOC127534 (Accession XM\_060532) is another VGAM381 host target gene. LOC127534 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC127534, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127534 BINDING SITE, designated SEQ ID:37166, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18989] Another function of VGAM381 is therefore inhibition of LOC127534 (Accession XM\_060532). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127534. LOC144100 (Accession XM\_084732) is another VGAM381 host target gene. LOC144100 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144100, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144100 BINDING SITE, designated SEQ ID:37677, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18990] Another function of VGAM381 is therefore inhibition of LOC144100 (Accession XM\_084732). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC144100. LOC144289 (Accession XM\_096565) is another VGAM381 host target gene. LOC144289 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC144289, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144289 BINDING SITE, designated SEQ ID:40397, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18991] Another function of VGAM381 is therefore inhibition of LOC144289 (Accession XM\_096565). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144289. LOC145468 (Accession XM\_057874) is another VGAM381 host target gene. LOC145468 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145468, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145468 BINDING SITE, designated SEQ ID:36547, to the nucleotide sequence of VGAM381 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3092.

[18992] Another function of VGAM381 is therefore inhibition of LOC145468 (Accession XM\_057874). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145468. LOC145854 (Accession XM\_085259) is another VGAM381 host target gene. LOC145854 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145854, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145854 BINDING SITE, designated SEQ ID:38005, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18993] Another function of VGAM381 is therefore inhibition of LOC145854 (Accession XM\_085259). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145854. LOC150150 (Accession XM\_097820) is another VGAM381 host target gene. LOC150150 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150150, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150150 BINDING SITE, designated SEQ ID:41135, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18994] Another function of VGAM381 is therefore inhibition of LOC150150 (Accession XM\_097820). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150150. LOC150155 (Accession XM\_047977) is another VGAM381 host target gene. LOC150155 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150155, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150155 BINDING SITE, designated SEQ ID:35088, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18995] Another function of VGAM381 is therefore inhibition of LOC150155 (Accession XM\_047977). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC150155. LOC150299 (Accession XM\_097869) is another VGAM381 host target gene. LOC150299 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150299, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150299 BINDING SITE, designated SEQ ID:41180, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18996] Another function of VGAM381 is therefore inhibition of LOC150299 (Accession XM\_097869). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150299. LOC158956 (Accession XM\_039450) is another VGAM381 host target gene. LOC158956 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158956, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158956 BINDING SITE, designated SEQ ID:33096, to

the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18997] Another function of VGAM381 is therefore inhibition of LOC158956 (Accession XM\_039450). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158956. LOC163412 (Accession XM\_088868) is another VGAM381 host target gene. LOC163412 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC163412, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163412 BINDING SITE, designated SEQ ID:39949, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18998] Another function of VGAM381 is therefore inhibition of LOC163412 (Accession XM\_088868). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163412. LOC256222 (Accession XM\_173177) is another VGAM381 host target gene. LOC256222 BINDING SITE is HOST TARGET binding site found in the 5` un-

translated region of mRNA encoded by LOC256222, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256222 BINDING SITE, designated SEQ ID:46425, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[18999] Another function of VGAM381 is therefore inhibition of LOC256222 (Accession XM\_173177). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256222. LOC51170 (Accession NM\_016245) is another VGAM381 host target gene. LOC51170 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51170, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51170 BINDING SITE, designated SEQ ID:18362, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[19000] Another function of VGAM381 is therefore inhibition of LOC51170 (Accession NM\_016245). Accordingly, utilities

of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51170. LOC90288 (Accession XM\_030669) is another VGAM381 host target gene. LOC90288 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90288, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90288 BINDING SITE, designated SEQ ID:31114, to the nucleotide sequence of VGAM381 RNA, herein designated VGAM RNA, also designated SEQ ID:3092.

[19001] Another function of VGAM381 is therefore inhibition of LOC90288 (Accession XM\_030669). Accordingly, utilities of VGAM381 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90288. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 382 (VGAM382) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19002] VGAM382 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM382 was detected is described hereinabove with reference to Figs. 1–8.

[19003] VGAM382 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis A Virus. VGAM382 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19004] VGAM382 gene encodes a VGAM382 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM382 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM382 precursor RNA is designated SEQ ID:368, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:368 is located at position 4814 relative to the genome of Hepatitis A Virus.

[19005] VGAM382 precursor RNA folds onto itself, forming VGAM382 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19006] An enzyme complex designated DICER COMPLEX, `dices` the VGAM382 folded precursor RNA into VGAM382 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM382 RNA is designated SEQ ID:3093, and is provided hereinbelow with reference to the sequence listing part.

[19007] VGAM382 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM382 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM382 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[19008] VGAM382 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM382 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM382 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM382 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM382 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19009] The complementary binding of VGAM382 RNA, herein designated VGAM RNA, to host target binding sites on VGAM382 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM382 host target RNA into VGAM382 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19010] It is appreciated that VGAM382 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM382 host target genes. The mRNA of each one of this plurality of VGAM382 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM382 RNA, herein designated VGAM RNA, and which when bound by VGAM382 RNA causes inhibition of translation of respective one or more VGAM382 host target proteins.

[19011] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM382 gene, herein designated VGAM GENE, on one or more VGAM382 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[19012] It is yet further appreciated that a function of VGAM382 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM382 include diagnosis, prevention and treatment of viral infection by Hepatitis A Virus. Specific functions, and accordingly utilities, of VGAM382 correlate with, and may be deduced from, the identity of the host target genes which VGAM382 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19013] Nucleotide sequences of the VGAM382 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the  
`diced` VGAM382 RNA, herein designated VGAM RNA,  
and a schematic representation of the secondary folding  
of VGAM382 folded precursor RNA, herein designated  
VGAM FOLDED PRECURSOR RNA, of VGAM382 are further  
described hereinbelow with reference to Table 1.

[19014] Nucleotide sequences of host target binding sites, such as  
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of  
Fig. 1, found on VGAM382 host target RNA, and schematic  
representation of the complementarity of each of these  
host target binding sites to VGAM382 RNA, herein desig-  
nated VGAM RNA, are described hereinbelow with refer-  
ence to Table 2.

[19015] As mentioned hereinabove with reference to Fig. 1, a  
function of VGAM382 gene, herein designated VGAM is  
inhibition of expression of VGAM382 target genes. It is  
appreciated that specific functions, and accordingly utili-  
ties, of VGAM382 correlate with, and may be deduced  
from, the identity of the target genes which VGAM382  
binds and inhibits, and the function of these target genes,  
as elaborated hereinbelow.

[19016] Protein Tyrosine Phosphatase, Receptor Type, C (PTPRC,  
Accession NM\_080923) is a VGAM382 host target gene.

PTPRC BINDING SITE1 through PTPRC BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PTPRC, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTPRC BINDING SITE1 through PTPRC BINDING SITE3, designated SEQ ID:28150, SEQ ID:8719 and SEQ ID:28145 respectively, to the nucleotide sequence of VGAM382 RNA, herein designated VGAM RNA, also designated SEQ ID:3093.

[19017] A function of VGAM382 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, C (PTPRC, Accession NM\_080923). Accordingly, utilities of VGAM382 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPRC. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 383 (VGAM383) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19018] VGAM383 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM383 was detected is described hereinabove with reference to Figs. 1–8.

[19019] VGAM383 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis A Virus.

VGAM383 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19020] VGAM383 gene encodes a VGAM383 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM383 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM383 precursor RNA is designated SEQ ID:369, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:369 is located at position 6678 relative to the genome of Hepatitis A Virus.

[19021] VGAM383 precursor RNA folds onto itself, forming VGAM383 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19022] An enzyme complex designated DICER COMPLEX, `dices` the VGAM383 folded precursor RNA into VGAM383 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM383 RNA is designated SEQ ID:3094, and is provided hereinbelow with reference to the sequence listing part.

[19023] VGAM383 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM383 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM383 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19024] VGAM383 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM383 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM383 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM383 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM383 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[19025] The complementary binding of VGAM383 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM383 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM383 host target RNA into VGAM383 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19026] It is appreciated that VGAM383 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM383 host target genes. The mRNA of each one of this plurality of VGAM383 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM383 RNA, herein designated VGAM RNA, and which when bound by VGAM383 RNA causes inhibition of translation of respective one or more VGAM383 host target proteins.

[19027] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM383 gene, herein designated VGAM GENE, on one or more VGAM383 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[19028] It is yet further appreciated that a function of VGAM383 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM383 include diagnosis, prevention and treatment of viral infection by Hepatitis A Virus. Specific functions, and accordingly utilities, of VGAM383 correlate with, and may be deduced from, the identity of the host target genes which VGAM383 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19029] Nucleotide sequences of the VGAM383 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM383 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM383 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM383 are further described hereinbelow with reference to Table 1.

[19030] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM383 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM383 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19031] As mentioned hereinabove with reference to Fig. 1, a function of VGAM383 gene, herein designated VGAM is inhibition of expression of VGAM383 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM383 correlate with, and may be deduced from, the identity of the target genes which VGAM383 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19032] Kinesin Family Member 5C (KIF5C, Accession NM\_004522) is a VGAM383 host target gene. KIF5C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIF5C, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIF5C BINDING SITE, designated SEQ ID:10859, to the nucleotide sequence of VGAM383 RNA, herein designated VGAM RNA, also designated SEQ ID:3094.

[19033] A function of VGAM383 is therefore inhibition of Kinesin Family Member 5C (KIF5C, Accession NM\_004522). Accordingly, utilities of VGAM383 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIF5C. Membrane Cofactor Protein (CD46, trophoblast-lymphocyte cross-reactive antigen) (MCP, Accession NM\_002389) is another VGAM383 host target gene. MCP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MCP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MCP BINDING SITE, designated SEQ ID:8204, to the nucleotide sequence of VGAM383 RNA, herein designated VGAM RNA, also designated SEQ ID:3094.

[19034] Another function of VGAM383 is therefore inhibition of Membrane Cofactor Protein (CD46, trophoblast-lympho-

cyte cross-reactive antigen) (MCP, Accession NM\_002389), a gene which may be involved in the regulation of complement activation. Accordingly, utilities of VGAM383 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCP. The function of MCP has been established by previous studies. MCP, a C3B/C4B-binding molecule of the complement system with cofactor activity for the I-dependent cleavage of C3B and C4B, is widely distributed in white blood cells, platelets, epithelial cells, and fibroblasts. Lublin et al. (1988) purified MCP from a human T-cell line and determined the sequence of the N-terminal 24 amino acids. An oligonucleotide probe was used to identify a clone from a human monocyte cDNA library. The deduced full-length MCP consists of a 34-amino acid signal peptide and a 350-amino acid mature protein. The protein has, beginning at the N terminus, 4 cysteine-rich repeating units (short consensus repeats, or SCRs) of about 60 amino acids each that match the consensus sequence found in a multigene family of complement regulatory proteins: CR1 (OMIM Ref. No. 120620), CR2 (OMIM Ref. No. 120650), C4BP (OMIM Ref. No. 120830), FH (OMIM Ref. No. 134370), and DAF (OMIM Ref. No. 125240). Immediately

C-terminal of the SCRs is a serine/threonine/proline (STP)-rich region, a likely area for extensive O-glycosylation. MCP also has a transmembrane domain, a basic amino acid anchor, and a cytoplasmic tail. Purcell et al. (1991) and Post et al. (1991) identified 4 and 6 isoforms of MCP, respectively. Post et al. (1991) demonstrated that the 6 isoforms vary in having 1 of 2 cytoplasmic tails and by having either all 3 STP regions (termed A, B, and C) or only STP-BC or STP-C. They showed that the STP-C isoforms are expressed as 45- to 55-kD proteins, the STP-BC isoforms are expressed as 55- to 65-kD proteins, and the STP-ABC isoforms are expressed as 65- to 75-kD proteins. The 65- to 75-kD variants were not expressed on peripheral blood cells or cell lines. Post et al. (1991) concluded that the presence of the B region of the STP area, which is richer in O-linked sugars, determines the expression of the 2 broad protein species. They also noted that up to 4 different forms of MCP are expressed on a single cell. Lublin et al. (1988) localized MCP to 1q31-q41 by Southern analysis of human-rodent somatic cell hybrid DNA and by in situ hybridization. This was the sixth member of this multigene family that had been assigned to this region of the genome. Bora et al. (1989)

demonstrated that the MCP gene is on the same 1,250-kb NotI fragment that contains CR1, CR2, DAF, and C4BP and maps within 100 kb of the 3-prime end of the CR1 gene. The order of the genes appears to be that just indicated, with MCP preceding the other 4 genes. Animal model experiments lend further support to the function of MCP. Marie et al. (2002) studied mice transgenic for human CD46 isoforms differing in their STP regions and in the length of their cytoplasmic domains. Mice expressing the 16-amino acid cytoplasmic tail variant, dubbed CD46-1, inhibited the T cell-mediated contact hypersensitivity reaction, whereas those expression the 23-residue cytoplasmic tail variant, termed CD46-2, increased it. CD46 stimulation or costimulation resulted in decreased cytotoxic activity and IL2 production, but increased proliferation and IL10 production, in CD46-1 transgenic mice. The effects were reversed in CD46-2 mice.

[19035] It is appreciated that the abovementioned animal model for MCP is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[19036] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

P. : Molecular cloning and chromosomal localization of human complement membrane cofactor protein (MCP): evidence for inclusion in the multigene family of complement-regulatory proteins. J. Exp. Med. 168: 181-194, 1988. ; and
- [19038] Post, T. W.; Liszewski, M. K.; Adams, E. M.; Tedja, I.; Miller, E. A.; Atkinson, J. P. : Membrane cofactor protein of the complement system: alternative splicing of serine/threonine/prol.
- [19039] Further studies establishing the function and utilities of MCP are found in John Hopkins OMIM database record ID 120920, and in cited publications numbered 347-356 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Src-like-adaptor (SLA, Accession NM\_006748) is another VGAM383 host target gene. SLA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of SLA BINDING SITE, designated SEQ ID:13596, to the nucleotide sequence of VGAM383 RNA, herein designated VGAM RNA, also designated SEQ ID:3094.

[19040] Another function of VGAM383 is therefore inhibition of Src-like-adaptor (SLA, Accession NM\_006748), a gene which is a negative regulator of T-cell receptor signaling. Accordingly, utilities of VGAM383 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLA. The function of SLA has been established by previous studies. Pandey et al. (1995) isolated a mouse cDNA using the 2-hybrid system to screen for molecules that interact with the cytoplasmic domain of Eck, a mouse receptor protein kinase (OMIM Ref. No. 176946). The predicted 281-amino acid protein has both SH3 and SH2 adaptor motifs similar to those in the Src family of nonreceptor tyrosine kinases but had no catalytic domain. The protein was named Slap (Src-like adaptor protein) by the authors. Recombinant Slap was shown to bind to activated Eck receptor tyrosine kinase. Angrist et al. (1995) cloned a cDNA for the putative human homolog of the gene, symbolized SLA. The predicted protein has 87% overall identity to the mouse sequence. Sosinowski et al. (2000) showed that SLA is a negative regula-

tor of T-cell receptor signaling. Holland et al. (2001) demonstrated that SLA and SLA2 (OMIM Ref. No. 606577) are both involved in downregulating T and B cell-mediated responses.

[19041] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19042] Angrist, M.; Wells, D. E.; Chakravarti, A.; Pandey, A. : Chromosomal localization of the mouse Src-like adapter protein (Slap) gene and its putative human homolog SLA. Genomics 30: 623–625, 1995. ; and

[19043] Sosinowski, T.; Pandey, A.; Dixit, V. M.; Weiss, A. : Src-like adaptor protein (SLAP) is a negative regulator of T cell receptor signaling. J. Exp. Med. 191: 463–474, 2000.

[19044] Further studies establishing the function and utilities of SLA are found in John Hopkins OMIM database record ID 601099, and in cited publications numbered 9491–949 and 9826 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. SORCS1 (Accession NM\_052918) is another VGAM383 host target gene. SORCS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SORCS1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SORCS1 BINDING SITE, designated SEQ ID:27481, to the nucleotide sequence of VGAM383 RNA, herein designated VGAM RNA, also designated SEQ ID:3094.

[19045] Another function of VGAM383 is therefore inhibition of SORCS1 (Accession NM\_052918). Accordingly, utilities of VGAM383 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SORCS1. Tumor Necrosis Factor, Alpha-induced Protein 1 (endothelial) (TNFAIP1, Accession NM\_021137) is another VGAM383 host target gene. TNFAIP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNFAIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFAIP1 BINDING SITE, designated SEQ ID:22111, to the nucleotide sequence of VGAM383 RNA, herein designated VGAM RNA, also designated SEQ ID:3094.

[19046] Another function of VGAM383 is therefore inhibition of Tumor Necrosis Factor, Alpha-induced Protein 1

(endothelial) (TNFAIP1, Accession NM\_021137). Accordingly, utilities of VGAM383 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFAIP1. Aminoadipate-semialdehyde Dehydrogenase-phosphopantetheinyl Transferase (AASDHPPT, Accession NM\_015423) is another VGAM383 host target gene. AASDHPPT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AASDHPPT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AASDHPPT BINDING SITE, designated SEQ ID:17724, to the nucleotide sequence of VGAM383 RNA, herein designated VGAM RNA, also designated SEQ ID:3094.

[19047] Another function of VGAM383 is therefore inhibition of Aminoadipate-semialdehyde Dehydrogenase-phosphopantetheinyl Transferase (AASDHPPT, Accession NM\_015423). Accordingly, utilities of VGAM383 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AASDHPPT. DDM36 (Accession NM\_020962) is another VGAM383 host target gene. DDM36 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by DDM36, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDM36 BINDING SITE, designated SEQ ID:21954, to the nucleotide sequence of VGAM383 RNA, herein designated VGAM RNA, also designated SEQ ID:3094.

[19048] Another function of VGAM383 is therefore inhibition of DDM36 (Accession NM\_020962). Accordingly, utilities of VGAM383 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDM36. FLJ10853 (Accession NM\_018246) is another VGAM383 host target gene. FLJ10853 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10853, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10853 BINDING SITE, designated SEQ ID:20213, to the nucleotide sequence of VGAM383 RNA, herein designated VGAM RNA, also designated SEQ ID:3094.

[19049] Another function of VGAM383 is therefore inhibition of

FLJ10853 (Accession NM\_018246). Accordingly, utilities of VGAM383 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10853. FLJ14146 (Accession NM\_024709) is another VGAM383 host target gene. FLJ14146 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14146, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14146 BINDING SITE, designated SEQ ID:24035, to the nucleotide sequence of VGAM383 RNA, herein designated VGAM RNA, also designated SEQ ID:3094.

[19050] Another function of VGAM383 is therefore inhibition of FLJ14146 (Accession NM\_024709). Accordingly, utilities of VGAM383 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14146. KIAA0534 (Accession XM\_049349) is another VGAM383 host target gene. KIAA0534 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0534, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of KIAA0534 BINDING SITE, designated SEQ ID:35380, to the nucleotide sequence of VGAM383 RNA, herein designated VGAM RNA, also designated SEQ ID:3094.

[19051] Another function of VGAM383 is therefore inhibition of KIAA0534 (Accession XM\_049349). Accordingly, utilities of VGAM383 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0534. KIAA1918 (Accession XM\_054951) is another VGAM383 host target gene. KIAA1918 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1918, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1918 BINDING SITE, designated SEQ ID:36213, to the nucleotide sequence of VGAM383 RNA, herein designated VGAM RNA, also designated SEQ ID:3094.

[19052] Another function of VGAM383 is therefore inhibition of KIAA1918 (Accession XM\_054951). Accordingly, utilities of VGAM383 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1918. Myosin 5C (MYO5C, Accession NM\_018728) is

another VGAM383 host target gene. MYO5C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYO5C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYO5C BINDING SITE, designated SEQ ID:20818, to the nucleotide sequence of VGAM383 RNA, herein designated VGAM RNA, also designated SEQ ID:3094.

[19053] Another function of VGAM383 is therefore inhibition of Myosin 5C (MYO5C, Accession NM\_018728). Accordingly, utilities of VGAM383 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYO5C. Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4G (SEMA4G, Accession XM\_170638) is another VGAM383 host target gene. SEMA4G BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SEMA4G, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA4G BINDING SITE, designated SEQ ID:45409, to the

nucleotide sequence of VGAM383 RNA, herein designated VGAM RNA, also designated SEQ ID:3094.

[19054] Another function of VGAM383 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 4G (SEMA4G, Accession XM\_170638). Accordingly, utilities of VGAM383 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA4G. LOC152580 (Accession XM\_098240) is another VGAM383 host target gene. LOC152580 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152580, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152580 BINDING SITE, designated SEQ ID:41522, to the nucleotide sequence of VGAM383 RNA, herein designated VGAM RNA, also designated SEQ ID:3094.

[19055] Another function of VGAM383 is therefore inhibition of LOC152580 (Accession XM\_098240). Accordingly, utilities of VGAM383 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC152580. LOC91660 (Accession XM\_039902) is another VGAM383 host target gene. LOC91660 BINDING SITE1 and LOC91660 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC91660, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91660 BINDING SITE1 and LOC91660 BINDING SITE2, designated SEQ ID:33207 and SEQ ID:33210 respectively, to the nucleotide sequence of VGAM383 RNA, herein designated VGAM RNA, also designated SEQ ID:3094.

[19056] Another function of VGAM383 is therefore inhibition of LOC91660 (Accession XM\_039902). Accordingly, utilities of VGAM383 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91660. G Protein-coupled Receptor Kinase-interactor 2 (GIT2, Accession NM\_014776) is another VGAM384 host target gene. GIT2 BINDING SITE1 through GIT2 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GIT2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of GIT2 BINDING SITE1 through GIT2 BINDING SITE3, designated SEQ ID:16601, SEQ ID:27683 and SEQ ID:27696 respectively, to the nucleotide sequence of VGAM384 RNA, herein designated VGAM RNA, also designated SEQ ID:3095.

[19057] Another function of VGAM384 is therefore inhibition of G Protein-coupled Receptor Kinase-interactor 2 (GIT2, Accession NM\_014776). Accordingly, utilities of VGAM384 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GIT2. LOC154282 (Accession XM\_098505) is another VGAM384 host target gene. LOC154282 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154282, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154282 BINDING SITE, designated SEQ ID:41697, to the nucleotide sequence of VGAM384 RNA, herein designated VGAM RNA, also designated SEQ ID:3095.

[19058] Another function of VGAM384 is therefore inhibition of LOC154282 (Accession XM\_098505). Accordingly, utilities of VGAM384 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC154282. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 385 (VGAM385) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19059] VGAM385 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM385 was detected is described hereinabove with reference to Figs. 1–8.

[19060] VGAM385 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis A Virus. VGAM385 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19061] VGAM385 gene encodes a VGAM385 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM385 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM385 precursor RNA is designated SEQ

ID:371, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:371 is located at position 3807 relative to the genome of Hepatitis A Virus.

[19062] VGAM385 precursor RNA folds onto itself, forming VGAM385 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19063] An enzyme complex designated DICER COMPLEX, `dices` the VGAM385 folded precursor RNA into VGAM385 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM385 RNA is designated SEQ ID:3096, and is provided hereinbelow with reference to the sequence

listing part.

[19064] VGAM385 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM385 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM385 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19065] VGAM385 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM385 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM385 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM385 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM385 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19066] The complementary binding of VGAM385 RNA, herein designated VGAM RNA, to host target binding sites on VGAM385 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM385 host target RNA into VGAM385 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19067] It is appreciated that VGAM385 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM385 host target genes. The mRNA of each one of this plurality of VGAM385 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM385 RNA, herein designated VGAM

RNA, and which when bound by VGAM385 RNA causes inhibition of translation of respective one or more VGAM385 host target proteins.

[19068] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM385 gene, herein designated VGAM GENE, on one or more VGAM385 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[19069] It is yet further appreciated that a function of VGAM385 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM385 include diagnosis, prevention and treatment of viral infection by Hepatitis A Virus. Specific functions, and accordingly utilities, of VGAM385 correlate with, and may be deduced from, the identity of the host target genes which VGAM385 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19070] Nucleotide sequences of the VGAM385 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM385 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM385 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM385 are further described hereinbelow with reference to Table 1.

[19071] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM385 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM385 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19072] As mentioned hereinabove with reference to Fig. 1, a function of VGAM385 gene, herein designated VGAM is

inhibition of expression of VGAM385 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM385 correlate with, and may be deduced from, the identity of the target genes which VGAM385 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19073] Lipase A, Lysosomal Acid, Cholesterol Esterase (Wolman disease) (LIPA, Accession NM\_000235) is a VGAM385 host target gene. LIPA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LIPA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIPA BINDING SITE, designated SEQ ID:5745, to the nucleotide sequence of VGAM385 RNA, herein designated VGAM RNA, also designated SEQ ID:3096.

[19074] A function of VGAM385 is therefore inhibition of Lipase A, Lysosomal Acid, Cholesterol Esterase (Wolman disease) (LIPA, Accession NM\_000235). Accordingly, utilities of VGAM385 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIPA. DKFZP434E2135 (Accession NM\_030804) is another VGAM385 host target gene. DKFZP434E2135 BINDING

SITE is HOST TARGET binding site found in the 3` un-translated region of mRNA encoded by DKFZP434E2135, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434E2135 BINDING SITE, designated SEQ ID:25113, to the nucleotide sequence of VGAM385 RNA, herein designated VGAM RNA, also designated SEQ ID:3096.

[19075] Another function of VGAM385 is therefore inhibition of DKFZP434E2135 (Accession NM\_030804). Accordingly, utilities of VGAM385 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434E2135. FLJ10232 (Accession NM\_018033) is another VGAM385 host target gene. FLJ10232 BINDING SITE is HOST TARGET binding site found in the 3` un-translated region of mRNA encoded by FLJ10232, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10232 BINDING SITE, designated SEQ ID:19773, to the nucleotide sequence of VGAM385 RNA, herein designated VGAM RNA, also designated SEQ ID:3096.

[19076] Another function of VGAM385 is therefore inhibition of FLJ10232 (Accession NM\_018033). Accordingly, utilities of VGAM385 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10232. FLJ10687 (Accession NM\_018178) is another VGAM385 host target gene. FLJ10687 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10687, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10687 BINDING SITE, designated SEQ ID:20007, to the nucleotide sequence of VGAM385 RNA, herein designated VGAM RNA, also designated SEQ ID:3096.

[19077] Another function of VGAM385 is therefore inhibition of FLJ10687 (Accession NM\_018178). Accordingly, utilities of VGAM385 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10687. FLJ10813 (Accession NM\_018229) is another VGAM385 host target gene. FLJ10813 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10813, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10813 BINDING SITE, designated SEQ ID:20167, to the nucleotide sequence of VGAM385 RNA, herein designated VGAM RNA, also designated SEQ ID:3096.

[19078] Another function of VGAM385 is therefore inhibition of FLJ10813 (Accession NM\_018229). Accordingly, utilities of VGAM385 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10813. FLJ13912 (Accession NM\_022770) is another VGAM385 host target gene. FLJ13912 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13912, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13912 BINDING SITE, designated SEQ ID:23027, to the nucleotide sequence of VGAM385 RNA, herein designated VGAM RNA, also designated SEQ ID:3096.

[19079] Another function of VGAM385 is therefore inhibition of FLJ13912 (Accession NM\_022770). Accordingly, utilities of VGAM385 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13912.

FLJ20519 (Accession NM\_017860) is another VGAM385 host target gene. FLJ20519 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20519, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20519 BINDING SITE, designated SEQ ID:19537, to the nucleotide sequence of VGAM385 RNA, herein designated VGAM RNA, also designated SEQ ID:3096.

[19080] Another function of VGAM385 is therefore inhibition of FLJ20519 (Accession NM\_017860). Accordingly, utilities of VGAM385 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20519. KIAA0217 (Accession XM\_040265) is another VGAM385 host target gene. KIAA0217 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0217, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0217 BINDING SITE, designated SEQ ID:33276, to the nucleotide sequence of VGAM385 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3096.

[19081] Another function of VGAM385 is therefore inhibition of KIAA0217 (Accession XM\_040265). Accordingly, utilities of VGAM385 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0217. KIAA0417 (Accession XM\_048898) is another VGAM385 host target gene. KIAA0417 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0417, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0417 BINDING SITE, designated SEQ ID:35287, to the nucleotide sequence of VGAM385 RNA, herein designated VGAM RNA, also designated SEQ ID:3096.

[19082] Another function of VGAM385 is therefore inhibition of KIAA0417 (Accession XM\_048898). Accordingly, utilities of VGAM385 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0417. KIAA0451 (Accession NM\_014826) is another VGAM385 host target gene. KIAA0451 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0451, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0451 BINDING SITE, designated SEQ ID:16806, to the nucleotide sequence of VGAM385 RNA, herein designated VGAM RNA, also designated SEQ ID:3096.

[19083] Another function of VGAM385 is therefore inhibition of KIAA0451 (Accession NM\_014826). Accordingly, utilities of VGAM385 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0451. KIAA1500 (Accession XM\_034353) is another VGAM385 host target gene. KIAA1500 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1500, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1500 BINDING SITE, designated SEQ ID:32066, to the nucleotide sequence of VGAM385 RNA, herein designated VGAM RNA, also designated SEQ ID:3096.

[19084] Another function of VGAM385 is therefore inhibition of KIAA1500 (Accession XM\_034353). Accordingly, utilities of VGAM385 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1500. Oculomedin (OCLM, Accession NM\_022375) is another VGAM385 host target gene. OCLM BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by OCLM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OCLM BINDING SITE, designated SEQ ID:22762, to the nucleotide sequence of VGAM385 RNA, herein designated VGAM RNA, also designated SEQ ID:3096.

[19085] Another function of VGAM385 is therefore inhibition of Oculomedin (OCLM, Accession NM\_022375). Accordingly, utilities of VGAM385 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OCLM. LOC151475 (Accession XM\_098063) is another VGAM385 host target gene. LOC151475 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151475 BINDING SITE, designated SEQ ID:41357, to

the nucleotide sequence of VGAM385 RNA, herein designated VGAM RNA, also designated SEQ ID:3096.

[19086] Another function of VGAM385 is therefore inhibition of LOC151475 (Accession XM\_098063). Accordingly, utilities of VGAM385 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151475. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 386 (VGAM386) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19087] VGAM386 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM386 was detected is described hereinabove with reference to Figs. 1–8.

[19088] VGAM386 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Hepatitis A Virus. VGAM386 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19089] VGAM386 gene encodes a VGAM386 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM386 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM386 precursor RNA is designated SEQ ID:372, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:372 is located at position 1168 relative to the genome of Hepatitis A Virus.

[19090] VGAM386 precursor RNA folds onto itself, forming VGAM386 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19091] An enzyme complex designated DICER COMPLEX, `dices` the VGAM386 folded precursor RNA into VGAM386 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM386 RNA is designated SEQ ID:3097, and is provided hereinbelow with reference to the sequence listing part.

[19092] VGAM386 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM386 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM386 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[19093] VGAM386 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM386 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM386 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM386 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM386 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19094] The complementary binding of VGAM386 RNA, herein designated VGAM RNA, to host target binding sites on VGAM386 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM386 host target RNA into VGAM386 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19095] It is appreciated that VGAM386 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM386 host target genes. The mRNA of each one of this plurality of VGAM386 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM386 RNA, herein designated VGAM RNA, and which when bound by VGAM386 RNA causes inhibition of translation of respective one or more VGAM386 host target proteins.

[19096] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM386 gene, herein designated VGAM GENE, on one or more VGAM386 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[19097] It is yet further appreciated that a function of VGAM386 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM386 include diagnosis, prevention and treatment of viral infection by Hepatitis A Virus. Specific functions, and accordingly utilities, of VGAM386 correlate with, and may be deduced from, the identity of the host target genes which VGAM386 binds and inhibits, and the function of these host target genes, as elaborated herein—below.

[19098] Nucleotide sequences of the VGAM386 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM386 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM386 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM386 are further described hereinbelow with reference to Table 1.

[19099] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM386 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM386 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19100] As mentioned hereinabove with reference to Fig. 1, a function of VGAM386 gene, herein designated VGAM is inhibition of expression of VGAM386 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM386 correlate with, and may be deduced from, the identity of the target genes which VGAM386 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19101] Estrogen-related Receptor Beta Like 1 (ESRRBL1, Accession NM\_018010) is a VGAM386 host target gene. ESR-RBL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ESRRBL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESRRBL1 BINDING SITE, designated SEQ ID:19739, to the nucleotide sequence of VGAM386 RNA, herein designated VGAM RNA, also designated SEQ ID:3097.

[19102] A function of VGAM386 is therefore inhibition of Estro-

gen-related Receptor Beta Like 1 (ESRRBL1, Accession NM\_018010). Accordingly, utilities of VGAM386 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESRRBL1. Growth Differentiation Factor 8 (GDF8, Accession NM\_005259) is another VGAM386 host target gene. GDF8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GDF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GDF8 BINDING SITE, designated SEQ ID:11766, to the nucleotide sequence of VGAM386 RNA, herein designated VGAM RNA, also designated SEQ ID:3097.

[19103] Another function of VGAM386 is therefore inhibition of Growth Differentiation Factor 8 (GDF8, Accession NM\_005259), a gene which acts specifically as a negative regulator of skeletal muscle growth. Accordingly, utilities of VGAM386 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GDF8. The function of GDF8 has been established by previous studies. The transforming growth factor-beta superfamily encompasses a large number of growth and differentia-

tion factors that play important roles in regulating embryonic development and in maintaining tissue homeostasis in adult animals. GDF8, or myostatin, is a member of this superfamily with a role in the control and maintenance of skeletal muscle mass. Animal model experiments lend further support to the function of GDF8. To determine the biologic function of Gdf8, McPherron et al. (1997) disrupted the Gdf8 gene by gene targeting in mice. Gdf8-null animals were significantly larger than wildtype animals and showed a large and widespread increase in skeletal muscle mass. Individual muscles of mutant animals weighed 2 to 3 times more than those of wildtype animals, and the increase in mass appeared to result from a combination of muscle cell hyperplasia and hypertrophy. McPherron et al. (1997) suggested that Gdf8 functions specifically as a negative regulator of skeletal muscle growth. Lin et al. (2002) observed increased skeletal muscle mass in their myostatin-null mouse model compared to wildtype animals as early as 4 weeks of age. In addition, the mutant mice showed reduced production and secretion of leptin (OMIM Ref. No. 164160) which was associated with reduced fat deposition. The reduced adipogenesis in the knockout mice suggested that myostatin is

involved in regulating adiposity as well as muscularity.

[19104] It is appreciated that the abovementioned animal model for GDF8 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[19105] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19106] Gonzalez–Cadavid, N. F.; Taylor, W. E.; Yarasheski, K.; Sinha–Hikim, I.; Ma, K.; Ezzat, S.; Shen, R.; Lalani, R.; Asa, S.; Mamita, M.; Nair, G.; Arver, S.; Bhasin, S. : Organization of the human myostatin gene and expression in healthy men and HIV–infected men with muscle wasting. Proc. Nat. Acad. Sci. 95: 14938–14943, 1998. ; and

[19107] Lin, J.; Arnold, H. B.; Della–Fera, M. A.; Azain, M. J.; Hartzell, D. L.; Baile, C. A. : Myostatin knockout in mice increases myogenesis and decreases adipogenesis. Biochem. Biophys. Res.

[19108] Further studies establishing the function and utilities of GDF8 are found in John Hopkins OMIM database record ID 601788, and in cited publications numbered 1280–1283, 8868–8869, 421 and 9109–5789 listed in the bibliography section hereinbelow, which are also hereby incorpo–

rated by reference. Heparan Sulfate (glucosamine) 3-O-sulfotransferase 4 (HS3ST4, Accession XM\_056254) is another VGAM386 host target gene. HS3ST4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HS3ST4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HS3ST4 BINDING SITE, designated SEQ ID:36369, to the nucleotide sequence of VGAM386 RNA, herein designated VGAM RNA, also designated SEQ ID:3097.

[19109] Another function of VGAM386 is therefore inhibition of Heparan Sulfate (glucosamine) 3-O-sulfotransferase 4 (HS3ST4, Accession XM\_056254). Accordingly, utilities of VGAM386 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HS3ST4. MADS Box Transcription Enhancer Factor 2, Polypeptide C (myocyte enhancer factor 2C) (MEF2C, Accession NM\_002397) is another VGAM386 host target gene. MEF2C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MEF2C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of MEF2C BINDING SITE, designated SEQ ID:8211, to the nucleotide sequence of VGAM386 RNA, herein designated VGAM RNA, also designated SEQ ID:3097.

[19110] Another function of VGAM386 is therefore inhibition of MADS Box Transcription Enhancer Factor 2, Polypeptide C (myocyte enhancer factor 2C) (MEF2C, Accession NM\_002397), a gene which regulates muscle-specific and mitogen-inducible genes. Accordingly, utilities of VGAM386 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEF2C. The function of MEF2C has been established by previous studies. The MEF2 family of regulatory proteins are, like the myogenic basic helix-loop-helix proteins (e.g., 159970), involved in myogenesis; see MEF2A (OMIM Ref. No. 600660). McDermott et al. (1993) cloned a member of the MEF2 family of proteins from a human skeletal muscle cDNA library using a fragment of the MEF2A cDNA as a probe. Transcripts of MEF2C were found in the skeletal muscle and brain. Alternative splice variants were found, 1 of which was unique to the brain. Leifer et al. (1993) found that the brain form was expressed by neurons in

particular layers of the cerebral cortex and that expression declined during postnatal development. The skeletal isoform of the cDNA encodes a 465-amino acid protein with conserved MADS and MEF2 domains. Like the other MEF2 gene products, MEF2C has both DNA binding and trans-activating activities indistinguishable from other members of the family. MEF2C, however, is induced late during myogenic differentiation and has a strict tissue-specific pattern of expression not seen in MEF2A or MEF2B. Breitbart et al. (1993) suggested that, while MEF2A may be involved in induction of muscle differentiation, MEF2C may be involved with maintenance of the differentiated state. CREB-binding protein (CBP; 600140)/p300 (OMIM Ref. No. 602700) and p300/CBP-associated factor (PCAF; 602203) are coactivators for MEF2C during differentiation. Chen et al. (2000) showed that NCOA2 mediates the coactivation of MEF2C-dependent transcription through interaction with the MADS box domain of MEF2C. They proposed a model of cooperative interaction between NCOA2, myogenin (MYOG; 159980), and MEF2C in the regulation of muscle-specific gene expression. During mammalian development, electrical activity promotes the calcium-dependent survival of neurons that have made

appropriate synaptic connections. Mao et al. (1999) showed that calcium influx into cerebellar neurons triggers the activation of the MKK6 (OMIM Ref. No. 601254)–p38 MAP kinase (OMIM Ref. No. 600289) cascade and that the p38 MAP kinase then phosphorylates and activates MEF2s. Once activated by this calcium-dependent p38 MAP kinase signaling pathway, MEF2 can regulate the expression of genes that are critical for survival of newly differentiated neurons. These findings demonstrated that MEF2 is a calcium-regulated transcription factor and defined a function for MEF2 during nervous system development that is distinct from previously well-characterized functions of MEF2 during muscle differentiation. Martin et al. (1994) mapped Mef2 to mouse chromosome 13. By fluorescence in situ hybridization, Krainc et al. (1995) mapped human MEF2C to 5q14, a region with homology of synteny to the mouse location. Members of the MEF2 family of MADs–box transcription factors bind to an A–T–rich DNA sequence associated with muscle-specific genes. The murine MEF2C gene is expressed in heart precursor cells before formation of the linear heart tube. In mice homozygous for a known mutation of MEF2C, Lin et al. (1997) found that the heart tube

did not undergo looping morphogenesis, the future right ventricle did not form, and a subset of cardiac muscle genes was not expressed. The absence of the right ventricular region of the mutant correlated with downregulation of the dHAND gene, which encodes a basic helix-loop-helix transcription factor required for cardiac morphogenesis. The authors concluded that MEF2C is an essential regulator of cardiac morphogenesis and right ventricular development.

[19111] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19112] Breitbart, R. E.; Liang, C.; Smoot, L. B.; Laheru, D. A.; Mahdavi, V.; Nadal-Ginard, B. : A fourth human MEF2 transcription factor, hMEF2D, is an early marker of the myogenic lineage. *Development* 118: 1095-1106, 1993. ; and

[19113] Chen, S. L.; Dowhan, D. H.; Hosking, B. M.; Muscat, G. E. O. : The steroid receptor coactivator, GRIP-1, is necessary for MEF-2C-dependent gene expression and skeletal muscle differenti.

[19114] Further studies establishing the function and utilities of MEF2C are found in John Hopkins OMIM database record ID 600662, and in cited publications numbered 8293,

8303–8304, 7159, 8295–829 and 7243 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. SIP (Accession NM\_014412) is another VGAM386 host target gene. SIP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIP BINDING SITE, designated SEQ ID:15757, to the nucleotide sequence of VGAM386 RNA, herein designated VGAM RNA, also designated SEQ ID:3097.

[19115] Another function of VGAM386 is therefore inhibition of SIP (Accession NM\_014412). Accordingly, utilities of VGAM386 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIP. DKFZp434C0328 (Accession NM\_017577) is another VGAM386 host target gene. DKFZp434C0328 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp434C0328, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se–

quences of DKFZp434C0328 BINDING SITE, designated SEQ ID:19013, to the nucleotide sequence of VGAM386 RNA, herein designated VGAM RNA, also designated SEQ ID:3097.

[19116] Another function of VGAM386 is therefore inhibition of DKFZp434C0328 (Accession NM\_017577). Accordingly, utilities of VGAM386 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434C0328. FLJ10307 (Accession NM\_018053) is another VGAM386 host target gene. FLJ10307 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10307, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10307 BINDING SITE, designated SEQ ID:19813, to the nucleotide sequence of VGAM386 RNA, herein designated VGAM RNA, also designated SEQ ID:3097.

[19117] Another function of VGAM386 is therefore inhibition of FLJ10307 (Accession NM\_018053). Accordingly, utilities of VGAM386 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10307. KIAA0237 (Accession NM\_014747) is another VGAM386

host target gene. KIAA0237 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0237 BINDING SITE, designated SEQ ID:16437, to the nucleotide sequence of VGAM386 RNA, herein designated VGAM RNA, also designated SEQ ID:3097.

[19118] Another function of VGAM386 is therefore inhibition of KIAA0237 (Accession NM\_014747). Accordingly, utilities of VGAM386 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0237. KIAA1466 (Accession XM\_050285) is another VGAM386 host target gene. KIAA1466 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1466, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1466 BINDING SITE, designated SEQ ID:35602, to the nucleotide sequence of VGAM386 RNA, herein designated VGAM RNA, also designated SEQ ID:3097.

[19119] Another function of VGAM386 is therefore inhibition of KIAA1466 (Accession XM\_050285). Accordingly, utilities of VGAM386 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1466. Kv6.3 (Accession NM\_133490) is another VGAM386 host target gene. Kv6.3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by Kv6.3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Kv6.3 BINDING SITE, designated SEQ ID:28563, to the nucleotide sequence of VGAM386 RNA, herein designated VGAM RNA, also designated SEQ ID:3097.

[19120] Another function of VGAM386 is therefore inhibition of Kv6.3 (Accession NM\_133490). Accordingly, utilities of VGAM386 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Kv6.3. LOC145566 (Accession XM\_085174) is another VGAM386 host target gene. LOC145566 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC145566, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145566 BINDING SITE, designated SEQ ID:37898, to the nucleotide sequence of VGAM386 RNA, herein designated VGAM RNA, also designated SEQ ID:3097.

[19121] Another function of VGAM386 is therefore inhibition of LOC145566 (Accession XM\_085174). Accordingly, utilities of VGAM386 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145566. LOC220766 (Accession XM\_165471) is another VGAM386 host target gene. LOC220766 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220766, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220766 BINDING SITE, designated SEQ ID:43653, to the nucleotide sequence of VGAM386 RNA, herein designated VGAM RNA, also designated SEQ ID:3097.

[19122] Another function of VGAM386 is therefore inhibition of LOC220766 (Accession XM\_165471). Accordingly, utilities of VGAM386 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC220766. LOC253959 (Accession XM\_170749) is another VGAM386 host target gene. LOC253959 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253959, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253959 BINDING SITE, designated SEQ ID:45507, to the nucleotide sequence of VGAM386 RNA, herein designated VGAM RNA, also designated SEQ ID:3097.

[19123] Another function of VGAM386 is therefore inhibition of LOC253959 (Accession XM\_170749). Accordingly, utilities of VGAM386 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253959. LOC257438 (Accession XM\_168338) is another VGAM386 host target gene. LOC257438 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257438, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257438 BINDING SITE, designated SEQ ID:45107, to the nucleotide sequence of VGAM386 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3097.

[19124] Another function of VGAM386 is therefore inhibition of LOC257438 (Accession XM\_168338). Accordingly, utilities of VGAM386 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257438. LOC91012 (Accession XM\_035503) is another VGAM386 host target gene. LOC91012 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91012, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91012 BINDING SITE, designated SEQ ID:32283, to the nucleotide sequence of VGAM386 RNA, herein designated VGAM RNA, also designated SEQ ID:3097.

[19125] Another function of VGAM386 is therefore inhibition of LOC91012 (Accession XM\_035503). Accordingly, utilities of VGAM386 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91012. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 387 (VGAM387) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19126] VGAM387 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM387 was detected is described hereinabove with reference to Figs. 1–8.

[19127] VGAM387 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 1. VGAM387 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19128] VGAM387 gene encodes a VGAM387 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM387 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM387 precursor RNA is designated SEQ ID:373, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:373 is located at position 97453 relative to the genome of Equine Herpesvirus 1.

[19129] VGAM387 precursor RNA folds onto itself, forming

VGAM387 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19130] An enzyme complex designated DICER COMPLEX, `dices` the VGAM387 folded precursor RNA into VGAM387 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM387 RNA is designated SEQ ID:3098, and is provided hereinbelow with reference to the sequence listing part.

[19131] VGAM387 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM387 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM387 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19132] VGAM387 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM387 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM387 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM387 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM387 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19133] The complementary binding of VGAM387 RNA, herein designated VGAM RNA, to host target binding sites on VGAM387 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM387 host target RNA into VGAM387 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19134] It is appreciated that VGAM387 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM387 host target genes. The mRNA of each one of this plurality of VGAM387 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM387 RNA, herein designated VGAM RNA, and which when bound by VGAM387 RNA causes inhibition of translation of respective one or more VGAM387 host target proteins.

[19135] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM387 gene, herein designated VGAM GENE, on one or more VGAM387 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[19136] It is yet further appreciated that a function of VGAM387 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM387 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM387 correlate with, and may be deduced from, the identity of the host target genes which VGAM387 binds and inhibits, and

the function of these host target genes, as elaborated hereinbelow.

[19137] Nucleotide sequences of the VGAM387 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM387 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM387 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM387 are further described hereinbelow with reference to Table 1.

[19138] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM387 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM387 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19139] As mentioned hereinabove with reference to Fig. 1, a function of VGAM387 gene, herein designated VGAM is inhibition of expression of VGAM387 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM387 correlate with, and may be deduced from, the identity of the target genes which VGAM387 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[19140] A Disintegrin and Metalloproteinase Domain 11 (ADAM11, Accession NM\_002390) is a VGAM387 host target gene. ADAM11 BINDING SITE1 and ADAM11 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ADAM11, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAM11 BINDING SITE1 and ADAM11 BINDING SITE2, designated SEQ ID:8206 and SEQ ID:22239 respectively, to the nucleotide sequence of VGAM387 RNA, herein designated VGAM RNA, also designated SEQ ID:3098.

[19141] A function of VGAM387 is therefore inhibition of A Disintegrin and Metalloproteinase Domain 11 (ADAM11, Accession NM\_002390), a gene which Member of the ADAM family of zinc metalloproteases. Accordingly, utilities of VGAM387 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM11. The function of ADAM11 has been established by previous studies. From chromosomal region 17q21.3, where a tumor suppressor gene for breast and ovarian cancers is thought to reside, Emi et al. (1993) isolated a novel gene

from a cosmid clone that showed somatic rearrangements in 2 breast cancers. The gene encoded a 524-amino acid metalloproteinase-like, disintegrin-like, and cysteine-rich (MDC) protein with sequence similarity to members of the snake-venom metalloprotease/disintegrin family and guinea-pig sperm-surface protein PH-30 (OMIM Ref. No. 601533). These proteins have been implicated in cell-cell or cell-extracellular matrix interactions. Rearrangements in both tumors involved multiple exons and disrupted the coding region of the gene. Sagane et al. (1998) noted that MDC is a member of the cellular disintegrin, or ADAM (a disintegrin and metalloproteinase), family. See ADAM20 (OMIM Ref. No. 603712). They isolated cDNAs encoding 2 related human proteins, MDC2 (OMIM Ref. No. 603709) and MDC3 (OMIM Ref. No. 603710). Northern blot analysis revealed that, like the MDC2 and MDC3 mRNAs, the 5-kb MDC transcript was expressed predominantly in brain.

[19142] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19143] Emi, M.; Katagiri, T.; Harada, Y.; Saito, H.; Inazawa, J.; Ito, I.; Kasumi, F.; Nakamura, Y. : A novel metalloprotease/disintegrin-like gene at 17q21.3 is somatically rearranged in two

primary breast cancers. Nature Genet. 5: 151–157, 1993. ;  
and

[19144] Sagane, K.; Ohya, Y.; Hasegawa, Y.; Tanaka, I. : Metallo–proteinase–like, disintegrin–like, cysteine–rich proteins MDC2 and MDC3: novel human cellular disintegrins highly expressed in the.

[19145] Further studies establishing the function and utilities of ADAM11 are found in John Hopkins OMIM database record ID 155120, and in cited publications numbered 11102–1110 and 11444 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 388 (VGAM388) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19146] VGAM388 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM388 was detected is described hereinabove with reference to Figs. 1–8.

[19147] VGAM388 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Equine Herpesvirus 1. VGAM388 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19148] VGAM388 gene encodes a VGAM388 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM388 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM388 precursor RNA is designated SEQ ID:374, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:374 is located at position 97176 relative to the genome of Equine Herpesvirus 1.

[19149] VGAM388 precursor RNA folds onto itself, forming VGAM388 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19150] An enzyme complex designated DICER COMPLEX, `dices` the VGAM388 folded precursor RNA into VGAM388 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 68%) nucleotide sequence of VGAM388 RNA is designated SEQ ID:3099, and is provided hereinbelow with reference to the sequence listing part.

[19151] VGAM388 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM388 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM388 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19152] VGAM388 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM388 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM388 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM388 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM388 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19153] The complementary binding of VGAM388 RNA, herein designated VGAM RNA, to host target binding sites on VGAM388 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM388 host tar-

get RNA into VGAM388 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19154] It is appreciated that VGAM388 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM388 host target genes. The mRNA of each one of this plurality of VGAM388 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM388 RNA, herein designated VGAM RNA, and which when bound by VGAM388 RNA causes inhibition of translation of respective one or more VGAM388 host target proteins.

[19155] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM388 gene, herein designated VGAM GENE, on one or more VGAM388 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[19156] It is yet further appreciated that a function of VGAM388 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM388 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM388 correlate with, and may be deduced from, the identity of the host target genes which VGAM388 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19157] Nucleotide sequences of the VGAM388 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM388 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM388 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM388 are further

described hereinbelow with reference to Table 1.

[19158] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM388 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM388 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19159] As mentioned hereinabove with reference to Fig. 1, a function of VGAM388 gene, herein designated VGAM is inhibition of expression of VGAM388 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM388 correlate with, and may be deduced from, the identity of the target genes which VGAM388 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19160] Leucine-rich Repeat-containing 2 (LRRC2, Accession NM\_024512) is a VGAM388 host target gene. LRRC2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LRRC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LRRC2 BINDING SITE, designated SEQ ID:23704, to the nucleotide sequence of VGAM388 RNA, herein designated VGAM RNA, also designated SEQ ID:3099.

[19161] A function of VGAM388 is therefore inhibition of Leucine-rich Repeat-containing 2 (LRRC2, Accession NM\_024512). Accordingly, utilities of VGAM388 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRRC2. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 389 (VGAM389) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19162] VGAM389 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM389 was detected is described hereinabove with reference to Figs. 1–8.

[19163] VGAM389 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 1. VGAM389 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19164] VGAM389 gene encodes a VGAM389 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM389 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM389 precursor RNA is designated SEQ ID:375, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:375 is located at position 99186 relative to the genome of Equine Herpesvirus 1.

[19165] VGAM389 precursor RNA folds onto itself, forming VGAM389 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19166] An enzyme complex designated DICER COMPLEX, `dices` the VGAM389 folded precursor RNA into VGAM389 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM389 RNA is designated SEQ ID:3100, and is provided hereinbelow with reference to the sequence listing part.

[19167] VGAM389 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM389 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM389 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19168] VGAM389 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM389 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM389 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM389 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM389 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[19169] The complementary binding of VGAM389 RNA, herein designated VGAM RNA, to host target binding sites on VGAM389 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM389 host target RNA into VGAM389 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19170] It is appreciated that VGAM389 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM389 host target genes. The mRNA of each one of this plurality of VGAM389 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM389 RNA, herein designated VGAM RNA, and which when bound by VGAM389 RNA causes inhibition of translation of respective one or more VGAM389 host target proteins.

[19171] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM389 gene, herein designated VGAM GENE, on one or more VGAM389 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[19172] It is yet further appreciated that a function of VGAM389 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM389 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM389 correlate with, and may be deduced from, the identity of the host target genes which VGAM389 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19173] Nucleotide sequences of the VGAM389 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM389 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM389 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM389 are further described hereinbelow with reference to Table 1.

[19174] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM389 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM389 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19175] As mentioned hereinabove with reference to Fig. 1, a function of VGAM389 gene, herein designated VGAM is inhibition of expression of VGAM389 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM389 correlate with, and may be deduced from, the identity of the target genes which VGAM389 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19176] ATPase, Ca++ Transporting, Cardiac Muscle, Slow Twitch 2 (ATP2A2, Accession NM\_001681) is a VGAM389 host target gene. ATP2A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP2A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP2A2 BINDING SITE, designated SEQ ID:7400, to the nucleotide sequence of VGAM389 RNA, herein designated VGAM RNA, also designated SEQ ID:3100.

[19177] A function of VGAM389 is therefore inhibition of ATPase, Ca++ Transporting, Cardiac Muscle, Slow Twitch 2 (ATP2A2, Accession NM\_001681). Accordingly, utilities of VGAM389 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP2A2. Guanine Nucleotide Binding Protein (G protein), Beta Polypeptide 2 (GNB2, Accession NM\_005273) is another VGAM389 host target gene. GNB2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GNB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNB2 BINDING SITE, designated SEQ ID:11777, to the nucleotide sequence of VGAM389 RNA, herein designated VGAM RNA, also designated SEQ ID:3100.

[19178] Another function of VGAM389 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Beta Polypeptide 2 (GNB2, Accession NM\_005273). Accordingly, utilities of VGAM389 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNB2. Histone Deacetylase 4 (HDAC4, Accession NM\_006037) is another VGAM389 host target gene.

HDAC4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HDAC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HDAC4 BINDING SITE, designated SEQ ID:12660, to the nucleotide sequence of VGAM389 RNA, herein designated VGAM RNA, also designated SEQ ID:3100.

[19179] Another function of VGAM389 is therefore inhibition of Histone Deacetylase 4 (HDAC4, Accession NM\_006037), a gene which is responsible for the deacetylation of lysine residues on the n-terminal part of the core histones and may mediate transcriptional regulation. Accordingly, utilities of VGAM389 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HDAC4. The function of HDAC4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM264.FLJ20699 (Accession NM\_017931) is another VGAM389 host target gene. FLJ20699 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20699, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20699 BINDING SITE, designated SEQ ID:19618, to the nucleotide sequence of VGAM389 RNA, herein designated VGAM RNA, also designated SEQ ID:3100.

[19180] Another function of VGAM389 is therefore inhibition of FLJ20699 (Accession NM\_017931). Accordingly, utilities of VGAM389 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20699. MGC15937 (Accession NM\_080661) is another VGAM389 host target gene. MGC15937 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC15937, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15937 BINDING SITE, designated SEQ ID:27948, to the nucleotide sequence of VGAM389 RNA, herein designated VGAM RNA, also designated SEQ ID:3100.

[19181] Another function of VGAM389 is therefore inhibition of MGC15937 (Accession NM\_080661). Accordingly, utilities of VGAM389 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with MGC15937. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 390 (VGAM390) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19182] VGAM390 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM390 was detected is described hereinabove with reference to Figs. 1–8.

[19183] VGAM390 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 1. VGAM390 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19184] VGAM390 gene encodes a VGAM390 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM390 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM390 precursor RNA is designated SEQ

ID:376, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:376 is located at position 98078 relative to the genome of Equine Herpesvirus 1.

[19185] VGAM390 precursor RNA folds onto itself, forming VGAM390 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19186] An enzyme complex designated DICER COMPLEX, `dices` the VGAM390 folded precursor RNA into VGAM390 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM390 RNA is designated SEQ ID:3101, and is provided hereinbelow with reference to the sequence

listing part.

[19187] VGAM390 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM390 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM390 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19188] VGAM390 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM390 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM390 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM390 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM390 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19189] The complementary binding of VGAM390 RNA, herein designated VGAM RNA, to host target binding sites on VGAM390 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM390 host target RNA into VGAM390 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19190] It is appreciated that VGAM390 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM390 host target genes. The mRNA of each one of this plurality of VGAM390 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM390 RNA, herein designated VGAM

RNA, and which when bound by VGAM390 RNA causes inhibition of translation of respective one or more VGAM390 host target proteins.

[19191] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM390 gene, herein designated VGAM GENE, on one or more VGAM390 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[19192] It is yet further appreciated that a function of VGAM390 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM390 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM390 correlate with, and may be deduced from, the identity of the host target genes which VGAM390 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19193] Nucleotide sequences of the VGAM390 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM390 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM390 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM390 are further described hereinbelow with reference to Table 1.

[19194] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM390 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM390 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19195] As mentioned hereinabove with reference to Fig. 1, a function of VGAM390 gene, herein designated VGAM is

inhibition of expression of VGAM390 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM390 correlate with, and may be deduced from, the identity of the target genes which VGAM390 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19196] Alkaline Phosphatase, Placental-like 2 (ALPPL2, Accession XM\_044139) is a VGAM390 host target gene. ALPPL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ALPPL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALPPL2 BINDING SITE, designated SEQ ID:34139, to the nucleotide sequence of VGAM390 RNA, herein designated VGAM RNA, also designated SEQ ID:3101.

[19197] A function of VGAM390 is therefore inhibition of Alkaline Phosphatase, Placental-like 2 (ALPPL2, Accession XM\_044139). Accordingly, utilities of VGAM390 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALPPL2. Ephrin-B1 (EFNB1, Accession NM\_004429) is another VGAM390 host target gene. EFNB1 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by EFNB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFNB1 BINDING SITE, designated SEQ ID:10708, to the nucleotide sequence of VGAM390 RNA, herein designated VGAM RNA, also designated SEQ ID:3101.

[19198] Another function of VGAM390 is therefore inhibition of Ephrin-B1 (EFNB1, Accession NM\_004429), a gene which is a transmembrane ligand of Eph-related receptor tyrosine kinases, has a role in cell adhesion. Accordingly, utilities of VGAM390 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFNB1. The function of EFNB1 has been established by previous studies. Bohme et al. (1996) presented evidence that LERK2 is a functional ligand of the EPH-related kinase HEK2 (EPHB3; 601839). They reported that coincubation of HEK2- and LERK2-expressing cells induces cell-cell adhesion and aggregation. Palmer et al. (2002) showed that SRC family kinases, or SFKs (see OMIM Ref. No. SRC; 190090), are positive regulators of ephrin-B phosphorylation and phosphotyrosine-mediated reverse signaling.

EphB receptor engagement of ephrin-B caused rapid recruitment of SFKs to ephrin-B expression domains and transient SFK activation. With delayed kinetics, ephrin-B ligands recruited the cytoplasmic PDZ domain-containing protein tyrosine phosphatase PTPBL (see OMIM Ref. No. 600267) and were dephosphorylated. These data suggested the presence of a switch mechanism that allows a shift from phosphotyrosine-/SFK-dependent signaling to PDZ-dependent signaling.

[19199] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19200] Bohme, B.; VandenBos, T.; Cerretti, D. P.; Park, L. S.; Holtrich, U.; Rubsamen-Waigmann, H.; Strebhardt, K. : Cell-cell adhesion mediated by binding of membrane-anchored ligand LERK-2 to the EPH-related receptor human embryonal kinase 2 promotes tyrosine kinase activity. J. Biol. Chem. 271: 24747-24752, 1996. ; and

[19201] Palmer, A.; Zimmer, M.; Erdmann, K. S.; Eulenburg, V.; Porthin, A.; Heumann, R.; Deutsch, U.; Klein, R. : EphrinB phosphorylation and reverse signaling: regulation by Src kinases and PTP.

[19202] Further studies establishing the function and utilities of

EFNB1 are found in John Hopkins OMIM database record ID 300035, and in cited publications numbered 8710–8713 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. 8-oxoguanine DNA Glycosylase (OGG1, Accession NM\_016819) is another VGAM390 host target gene. OGG1 BINDING SITE1 through OGG1 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by OGG1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OGG1 BINDING SITE1 through OGG1 BINDING SITE3, designated SEQ ID:18809, SEQ ID:8392 and SEQ ID:18814 respectively, to the nucleotide sequence of VGAM390 RNA, herein designated VGAM RNA, also designated SEQ ID:3101.

[19203] Another function of VGAM390 is therefore inhibition of 8-oxoguanine DNA Glycosylase (OGG1, Accession NM\_016819), a gene which is involved in base excision DNA repair and removal of 8-oxyguanine. Accordingly, utilities of VGAM390 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OGG1. The function of OGG1 has been established by

previous studies. The major mutagenic base lesion in DNA caused by exposure to reactive oxygen species is 8-oxoguanine. This damaged base is excised by a DNA glycosylase with an associated lyase activity for chain cleavage. Lu et al. (1997), Aburatani et al. (1997), Bjoras et al. (1997), Rosenquist et al. (1997), Radicella et al. (1997), and Roldan-Arjona et al. (1997) cloned human cDNAs with partial sequence homology to the yeast 8-oxoguanine DNA glycosylase (OGG1) gene. Radicella et al. (1997) found that the predicted protein has 345 amino acids and a calculated molecular mass of 39 kD. Roldan-Arjona et al. (1997), who called the enzyme 8-hydroxyguanine DNA glycosylase, estimated their 424-amino acid predicted human enzyme to have a size of 47 kD. They showed that it releases free 8-hydroxyguanine from oxidized DNA and introduces a chain break in a double-stranded oligonucleotide specifically at an 8-hydroxyguanine residue base-paired with cytosine. Expression of the human protein in a DNA repair-deficient *E. coli* strain partly suppressed its spontaneous mutator phenotype. Radicella et al. (1997) showed that when the human coding sequence was expressed in a yeast strain mutant in *Ogg1*, it was able to complement

the spontaneous mutator phenotype. Arai et al. (1997) also cloned the human OGG1 gene and, by Northern blotting, showed that the gene is ubiquitously expressed in a variety of human organs. By fluorescence in situ hybridization, Roldan-Arjona et al. (1997) and Radicella et al. (1997) mapped the human OGG1 gene to 3p25 (3p25.3-p25.2). By the same method, Arai et al. (1997) mapped the OGG1 gene to 3p26.2. By radiation hybrid analysis, Ishida et al. (1999) mapped the gene to 3p26, proximal to the VHL gene (OMIM Ref. No. 193300).

[19204] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19205] Radicella, J. P.; Dherin, C.; Desmaze, C.; Fox, M. S.; Boiteux, S. : Cloning and characterization of hOGG1, a human homolog of the OGG1 gene of *Saccharomyces cerevisiae*. Proc. Nat. Acad. Sci. 94: 8010-8015, 1997. ; and

[19206] Roldan-Arjona, T.; Wei, Y.-F.; Carter, K. C.; Klungland, A.; Anselmino, C.; Wang, R.-P.; Augustus, M.; Lindahl, T. : Molecular cloning and functional expression of a human cDNA encodin.

[19207] Further studies establishing the function and utilities of OGG1 are found in John Hopkins OMIM database record ID

601982, and in cited publications numbered 1214–1222, 887 and 8892–8893 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA1193 (Accession XM\_041843) is another VGAM390 host target gene. KIAA1193 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1193 BINDING SITE, designated SEQ ID:33581, to the nucleotide sequence of VGAM390 RNA, herein designated VGAM RNA, also designated SEQ ID:3101.

[19208] Another function of VGAM390 is therefore inhibition of KIAA1193 (Accession XM\_041843). Accordingly, utilities of VGAM390 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1193. MGC2835 (Accession NM\_024072) is another VGAM390 host target gene. MGC2835 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2835, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of MGC2835 BINDING SITE, designated SEQ ID:23505, to the nucleotide sequence of VGAM390 RNA, herein designated VGAM RNA, also designated SEQ ID:3101.

[19209] Another function of VGAM390 is therefore inhibition of MGC2835 (Accession NM\_024072). Accordingly, utilities of VGAM390 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2835. LOC124044 (Accession XM\_071871) is another VGAM390 host target gene. LOC124044 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC124044, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124044 BINDING SITE, designated SEQ ID:37431, to the nucleotide sequence of VGAM390 RNA, herein designated VGAM RNA, also designated SEQ ID:3101.

[19210] Another function of VGAM390 is therefore inhibition of LOC124044 (Accession XM\_071871). Accordingly, utilities of VGAM390 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124044. LOC256158 (Accession XM\_175125) is an-

other VGAM390 host target gene. LOC256158 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256158, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256158 BINDING SITE, designated SEQ ID:46628, to the nucleotide sequence of VGAM390 RNA, herein designated VGAM RNA, also designated SEQ ID:3101.

[19211] Another function of VGAM390 is therefore inhibition of LOC256158 (Accession XM\_175125). Accordingly, utilities of VGAM390 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256158. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 391 (VGAM391) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19212] VGAM391 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM391 was detected is described

hereinabove with reference to Figs. 1–8.

[19213] VGAM391 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 1. VGAM391 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19214] VGAM391 gene encodes a VGAM391 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM391 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM391 precursor RNA is designated SEQ ID:377, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:377 is located at position 98356 relative to the genome of Equine Herpesvirus 1.

[19215] VGAM391 precursor RNA folds onto itself, forming VGAM391 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed–reversed sequence of the nucleotide sequence of the second half thereof.

[19216] An enzyme complex designated DICER COMPLEX, `dices` the VGAM391 folded precursor RNA into VGAM391 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM391 RNA is designated SEQ ID:3102, and is provided hereinbelow with reference to the sequence listing part.

[19217] VGAM391 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM391 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM391 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19218] VGAM391 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM391 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM391 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM391 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM391 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19219] The complementary binding of VGAM391 RNA, herein designated VGAM RNA, to host target binding sites on VGAM391 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM391 host target RNA into VGAM391 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19220] It is appreciated that VGAM391 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM391 host target genes. The mRNA of each one of this plurality of VGAM391 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM391 RNA, herein designated VGAM RNA, and which when bound by VGAM391 RNA causes inhibition of translation of respective one or more VGAM391 host target proteins.

[19221] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM391 gene, herein designated VGAM GENE, on one or more VGAM391 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[19222] It is yet further appreciated that a function of VGAM391 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM391 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 1. Specific functions, and accordingly utilities, of VGAM391 correlate with, and may be deduced from, the identity of the host target genes which VGAM391 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19223] Nucleotide sequences of the VGAM391 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM391 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM391 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM391 are further described hereinbelow with reference to Table 1.

[19224] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM391 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM391 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19225] As mentioned hereinabove with reference to Fig. 1, a function of VGAM391 gene, herein designated VGAM is inhibition of expression of VGAM391 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM391 correlate with, and may be deduced from, the identity of the target genes which VGAM391 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19226] Chemokine (C-X3-C motif) Receptor 1 (CX3CR1, Accession XM\_047502) is a VGAM391 host target gene. CX3CR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CX3CR1, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CX3CR1 BINDING SITE, designated SEQ ID:34981, to the nucleotide sequence of VGAM391 RNA, herein designated VGAM RNA, also designated SEQ ID:3102.

[19227] A function of VGAM391 is therefore inhibition of Chemokine (C-X3-C motif) Receptor 1 (CX3CR1, Accession XM\_047502), a gene which mediates both the adhesive and migratory functions of fractalkine. Accordingly, utilities of VGAM391 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CX3CR1. The function of CX3CR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM25. Tripartite Motif-containing 14 (TRIM14, Accession NM\_014788) is another VGAM391 host target gene. TRIM14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM14 BINDING SITE,

designated SEQ ID:16667, to the nucleotide sequence of VGAM391 RNA, herein designated VGAM RNA, also designated SEQ ID:3102.

[19228] Another function of VGAM391 is therefore inhibition of Tripartite Motif-containing 14 (TRIM14, Accession NM\_014788), a gene which is composed of 3 zinc-binding domains and is involved in development and cell growth. Accordingly, utilities of VGAM391 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM14. The function of TRIM14 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM180. Amyloid Beta (A4) Precursor Protein-binding, Family A, Member 2 Binding Protein (APBA2BP, Accession NM\_031232) is another VGAM391 host target gene. APBA2BP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APBA2BP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APBA2BP BINDING SITE, designated SEQ ID:25278, to the nucleotide sequence of VGAM391 RNA, herein designated VGAM

RNA, also designated SEQ ID:3102.

[19229] Another function of VGAM391 is therefore inhibition of Amyloid Beta (A4) Precursor Protein-binding, Family A, Member 2 Binding Protein (APBA2BP, Accession NM\_031232). Accordingly, utilities of VGAM391 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APBA2BP. FLJ13241 (Accession NM\_025088) is another VGAM391 host target gene. FLJ13241 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13241, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13241 BINDING SITE, designated SEQ ID:24711, to the nucleotide sequence of VGAM391 RNA, herein designated VGAM RNA, also designated SEQ ID:3102.

[19230] Another function of VGAM391 is therefore inhibition of FLJ13241 (Accession NM\_025088). Accordingly, utilities of VGAM391 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13241. KIAA0914 (Accession NM\_014883) is another VGAM391 host target gene. KIAA0914 BINDING SITE is HOST TARGET

binding site found in the 5` untranslated region of mRNA encoded by KIAA0914, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0914 BINDING SITE, designated SEQ ID:17037, to the nucleotide sequence of VGAM391 RNA, herein designated VGAM RNA, also designated SEQ ID:3102.

[19231] Another function of VGAM391 is therefore inhibition of KIAA0914 (Accession NM\_014883). Accordingly, utilities of VGAM391 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0914. KIAA1796 (Accession XM\_166146) is another VGAM391 host target gene. KIAA1796 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1796, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1796 BINDING SITE, designated SEQ ID:43966, to the nucleotide sequence of VGAM391 RNA, herein designated VGAM RNA, also designated SEQ ID:3102.

[19232] Another function of VGAM391 is therefore inhibition of

KIAA1796 (Accession XM\_166146). Accordingly, utilities of VGAM391 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1796. Septin 3 (SEPT3, Accession NM\_019106) is another VGAM391 host target gene. SEPT3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEPT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEPT3 BINDING SITE, designated SEQ ID:21181, to the nucleotide sequence of VGAM391 RNA, herein designated VGAM RNA, also designated SEQ ID:3102.

[19233] Another function of VGAM391 is therefore inhibition of Septin 3 (SEPT3, Accession NM\_019106). Accordingly, utilities of VGAM391 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEPT3. LOC116437 (Accession XM\_058185) is another VGAM391 host target gene. LOC116437 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC116437, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC116437 BINDING SITE, designated SEQ ID:36583, to the nucleotide sequence of VGAM391 RNA, herein designated VGAM RNA, also designated SEQ ID:3102.

[19234] Another function of VGAM391 is therefore inhibition of LOC116437 (Accession XM\_058185). Accordingly, utilities of VGAM391 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC116437. LOC222134 (Accession XM\_168432) is another VGAM391 host target gene. LOC222134 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC222134, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222134 BINDING SITE, designated SEQ ID:45172, to the nucleotide sequence of VGAM391 RNA, herein designated VGAM RNA, also designated SEQ ID:3102.

[19235] Another function of VGAM391 is therefore inhibition of LOC222134 (Accession XM\_168432). Accordingly, utilities of VGAM391 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222134. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 392 (VGAM392) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19236] VGAM392 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM392 was detected is described hereinabove with reference to Figs. 1–8.

[19237] VGAM392 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Equine Herpesvirus 1. VGAM392 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19238] VGAM392 gene encodes a VGAM392 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM392 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM392 precursor RNA is designated SEQ ID:378, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:378 is

located at position 104567 relative to the genome of Equine Herpesvirus 1.

[19239] VGAM392 precursor RNA folds onto itself, forming VGAM392 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19240] An enzyme complex designated DICER COMPLEX, `dices` the VGAM392 folded precursor RNA into VGAM392 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM392 RNA is designated SEQ ID:3103, and is provided hereinbelow with reference to the sequence listing part.

[19241] VGAM392 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM392 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM392 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[19242] VGAM392 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM392 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM392 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM392 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM392 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[19243] The complementary binding of VGAM392 RNA, herein designated VGAM RNA, to host target binding sites on VGAM392 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM392 host target RNA into VGAM392 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19244] It is appreciated that VGAM392 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM392 host target genes. The mRNA of each one of this plurality of VGAM392 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM392 RNA, herein designated VGAM RNA, and which when bound by VGAM392 RNA causes inhibition of translation of respective one or more VGAM392

host target proteins.

[19245] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM392 gene, herein designated VGAM GENE, on one or more VGAM392 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[19246] It is yet further appreciated that a function of VGAM392 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM392 include diagnosis, prevention and treatment of viral infection by Equine Herpesvirus 1. Spe-

cific functions, and accordingly utilities, of VGAM392 correlate with, and may be deduced from, the identity of the host target genes which VGAM392 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19247] Nucleotide sequences of the VGAM392 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM392 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM392 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM392 are further described hereinbelow with reference to Table 1.

[19248] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM392 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM392 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19249] As mentioned hereinabove with reference to Fig. 1, a function of VGAM392 gene, herein designated VGAM is inhibition of expression of VGAM392 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM392 correlate with, and may be deduced from, the identity of the target genes which VGAM392 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19250] LOC125704 (Accession XM\_058931) is a VGAM392 host target gene. LOC125704 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC125704, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC125704 BINDING SITE, designated SEQ ID:36799, to the nucleotide sequence of VGAM392 RNA, herein designated VGAM RNA, also designated SEQ ID:3103.

[19251] A function of VGAM392 is therefore inhibition of LOC125704 (Accession XM\_058931). Accordingly, utilities of VGAM392 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC125704. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 393 (VGAM393) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[19252] VGAM393 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM393 was detected is described hereinabove with reference to Figs. 1–8.

[19253] VGAM393 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria Hypovirus 1. VGAM393 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19254] VGAM393 gene encodes a VGAM393 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM393 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM393 precursor RNA is designated SEQ ID:379, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:379 is located at position 4681 relative to the genome of Cryphonectria Hypovirus 1.

[19255] VGAM393 precursor RNA folds onto itself, forming VGAM393 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional  
`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[19256] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM393 folded precursor RNA into VGAM393 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 40%) nucleotide se-  
quence of VGAM393 RNA is designated SEQ ID:3104, and  
is provided hereinbelow with reference to the sequence  
listing part.

[19257] VGAM393 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM393 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM393 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19258] VGAM393 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM393 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM393 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM393 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM393 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19259] The complementary binding of VGAM393 RNA, herein designated VGAM RNA, to host target binding sites on VGAM393 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM393 host target RNA into VGAM393 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19260] It is appreciated that VGAM393 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM393 host target genes. The mRNA of each one of this plurality of VGAM393 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM393 RNA, herein designated VGAM RNA, and which when bound by VGAM393 RNA causes inhibition of translation of respective one or more VGAM393 host target proteins.

[19261] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM393 gene, herein designated VGAM GENE, on one or more VGAM393 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[19262] It is yet further appreciated that a function of VGAM393 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM393 include diagnosis, prevention and treatment of viral infection by Cryphonectria Hypovirus 1. Specific functions, and accordingly utilities, of VGAM393 correlate with, and may be deduced from, the identity of the host target genes which VGAM393 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

- [19263] Nucleotide sequences of the VGAM393 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM393 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM393 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM393 are further described hereinbelow with reference to Table 1.
- [19264] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM393 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM393 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [19265] As mentioned hereinabove with reference to Fig. 1, a function of VGAM393 gene, herein designated VGAM is inhibition of expression of VGAM393 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM393 correlate with, and may be deduced from, the identity of the target genes which VGAM393 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19266] AS3 (Accession NM\_015928) is a VGAM393 host target gene. AS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AS3 BINDING SITE, designated SEQ ID:18048, to the nucleotide sequence of VGAM393 RNA, herein designated VGAM RNA, also designated SEQ ID:3104.

[19267] A function of VGAM393 is therefore inhibition of AS3 (Accession NM\_015928), a gene which inhibits cell proliferation. Accordingly, utilities of VGAM393 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AS3. The function of AS3 has been established by previous studies. In the prostate of adult mammals, most epithelial cells are in a state of proliferative quiescence. Androgens regulate this effect by inducing cell cycle arrest in the G0/G1 phase. Geck et al. (2000) identified potential mediators of this androgen-induced proliferative shutoff by means of subtractive cDNA libraries. The expression pattern of one of these sequences, designated AS3, strongly correlated with the expression of the androgen-induced proliferative shutoff

both temporally and dosewise. The AS3 gene is upregulated during androgen-induced proliferative shutoff and induces cell proliferation arrest when expressed in a retrovirus transduced model. The deduced 1,391-amino acid AS3 protein has putative transactivating features, protein-protein interaction motifs (coiled coil and leucine zipper), and DNA-binding domains, suggesting that AS3 is a transcription factor. AS3 also has a protein-kinase motif, suggesting that it may act by phosphorylating a target protein. Geck et al. (1999) demonstrated that the transcript of the AS3 gene has 34 exons spanning approximately 200 kb of genomic DNA. By homology searching in GenBank, they demonstrated that the AS3 gene lies on 13q12-q13, downstream of the breast cancer susceptibility gene BRCA2 (OMIM Ref. No. 600185) and centromeric to the retinoblastoma (RB1; 180200) locus. Geck et al. (2001) presented data on the location of the AS3 gene in relation to BRCA2 and pointed out that the D13S171 marker, which had been widely used as an intra-genic marker of BRCA2, is actually located in the center of the 200-kb AS3 gene. The microsatellite instability of the S171 marker links the AS3 gene to a variety of cancers.

[19268] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [19269] Geck, P.; Sonnenschein, C.; Soto, A. M. : The D13S171 marker, misannotated to BRCA2, links the AS3 gene to various cancers. (Letter) Am. J. Hum. Genet. 69: 461–463, 2001. ; and
- [19270] Geck, P.; Szelei, J.; Jimenez, J.; Sonnenschein, C.; Soto, A. M. : Early gene expression during androgen-induced inhibition of proliferation of prostate cancer cells: a new suppressor.
- [19271] Further studies establishing the function and utilities of AS3 are found in John Hopkins OMIM database record ID 605333, and in cited publications numbered 4791–2307 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Citron (rho-interacting, serine/threonine kinase 21) (CIT, Accession XM\_045786) is another VGAM393 host target gene. CIT BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CIT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CIT BINDING SITE, designated SEQ ID:34561, to the nu-

cleotide sequence of VGAM393 RNA, herein designated VGAM RNA, also designated SEQ ID:3104.

[19272] Another function of VGAM393 is therefore inhibition of Citron (rho-interacting, serine/threonine kinase 21) (CIT, Accession XM\_045786), a gene which is increased several-fold by coexpression of constitutively active Rho . Accordingly, utilities of VGAM393 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CIT. The function of CIT has been established by previous studies. Activated Rho GTPases (see OMIM Ref. No. 602924) trigger distinctive kinase cascades. In particular, ROCK (see OMIM Ref. No. ROCK1, 601702) binds to Rho, and its kinase activity is moderately stimulated by this association. The citron molecule (Madaule et al., 1995), a specific interactor of Rho and Rac (see OMIM Ref. No. 602048), shares a significant degree of structural homology with ROCK; however, its lack of a kinase domain raised the question of its biologic function. By PCR of a mouse primary keratinocyte cDNA library, Di Cunto et al. (1998) identified a novel serine/threonine kinase, CRIK (citron Rho-interacting kinase), belonging to the myotonic dystrophy kinase (see OMIM Ref. No. 605377) family. CRIK can be expressed as at least 2 iso-

forms, one of which encompasses the previously reported form of citron in almost its entirety. The long form of CRIK is a 240-kD protein in which the kinase domain is followed by the sequence of citron. The short form, CRIK-SK (short kinase), is an approximately 54-kD protein that consists mostly of the kinase domain. CRIK and CRIK-SK proteins are capable of phosphorylating exogenous substrates as well as of autophosphorylation, when tested by in vitro kinase assays after expression into COS-7 cells. CRIK kinase activity is increased several-fold by coexpression of constitutively active Rho, while active Rac has more limited effects. Kinase activity of the endogenous CRIK is indicated by in vitro kinase assays after immunoprecipitation with antibodies recognizing the citron moiety of the protein. When expressed in keratinocytes, full-length CRIK, but not CRIK-SK, localizes into corpuscular cytoplasmic structures and elicits recruitment of actin into these structures. The previously reported Rho-associated kinases ROCK1 and ROCK2 (OMIM Ref. No. 604002) are ubiquitously expressed. Northern blot analysis of mouse tissues revealed a restricted pattern of expression limited to keratinocytes, brain, spleen, lung, kidney, and an especially strong signal in testis. No expression was detectable

in heart, liver, or skeletal muscle. The CRIK protein contains a kinase domain, a coiled-coil domain, a leucine-rich domain, a Rho-Rac binding domain, a zinc finger region, a pleckstrin homology domain, and a putative SH3-binding domain. Di Cunto et al. (1998) reported cloning the human homolog of the CRIK kinase domain. They stated that the human homolog of citron is contained within a PAC clone (GenBank AC002563) mapping to chromosome 12q. Animal model experiments lend further support to the function of CIT. Di Cunto et al. (2000) generated mice deficient in citron kinase by targeted disruption. Citron-K  $-/-$  mice grow at slower rates, are severely ataxic, and die before adulthood as a consequence of fatal seizures. Their brains display defective neurogenesis, with dramatic depletion of microneurons in the olfactory bulb, hippocampus, and cerebellum. These abnormalities arise during development of the central nervous system due to altered cytokinesis and massive apoptosis. Di Cunto et al. (2000) concluded that citron-K is essential for cytokinesis in vivo, in specific neuronal precursors only. Moreover, they suggested a novel molecular mechanism for a subset of human malformation syndromes of the central nervous system.

[19273] It is appreciated that the abovementioned animal model for CIT is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[19274] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19275] Di Cunto, F.; Imarisio, S.; Hirsch, E.; Broccoli, V.; Bulfone, A.; Migheli, A.; Atzori, C.; Turco, E.; Triolo, R.; Dotto, G. P.; Silengo, L.; Altruda, F. : Defective neurogenesis in citron kinase knockout mice by altered cytokinesis and massive apoptosis. *Neuron* 28: 115–127, 2000. ; and

[19276] Madaule, P.; Furuyashiki, T.; Reid, T.; Ishizaki, T.; Watanabe, G.; Morii, N.; Narumiya, S. : A novel partner for the GTP-bound forms of rho and rac. *FEBS Lett.* 377: 243–248, 1995.

[19277] Further studies establishing the function and utilities of CIT are found in John Hopkins OMIM database record ID 605629, and in sited publications numbered 6960–696 and 8593 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fragile X Mental Retardation 1 (FMR1, Accession NM\_002024) is another VGAM393 host target gene. FMR1 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FMR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FMR1 BINDING SITE, designated SEQ ID:7774, to the nucleotide sequence of VGAM393 RNA, herein designated VGAM RNA, also designated SEQ ID:3104.

[19278] Another function of VGAM393 is therefore inhibition of Fragile X Mental Retardation 1 (FMR1, Accession NM\_002024). Accordingly, utilities of VGAM393 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FMR1. Radixin (RDX, Accession NM\_002906) is another VGAM393 host target gene. RDX BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RDX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RDX BINDING SITE, designated SEQ ID:8807, to the nucleotide sequence of VGAM393 RNA, herein designated VGAM RNA, also designated SEQ ID:3104.

[19279] Another function of VGAM393 is therefore inhibition of

Radixin (RDX, Accession NM\_002906), a gene which plays a crucial role in the binding of the barbed end of actin filaments to the plasma membrane. Accordingly, utilities of VGAM393 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RDX. The function of RDX and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM290. Chromosome 20 Open Reading Frame 130 (C20orf130, Accession XM\_029741) is another VGAM393 host target gene. C20orf130 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C20orf130, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf130 BINDING SITE, designated SEQ ID:30935, to the nucleotide sequence of VGAM393 RNA, herein designated VGAM RNA, also designated SEQ ID:3104.

[19280] Another function of VGAM393 is therefore inhibition of Chromosome 20 Open Reading Frame 130 (C20orf130, Accession XM\_029741). Accordingly, utilities of VGAM393 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with C20orf130. CDK5 Regulatory Subunit Associated Protein 3 (CDK5RAP3, Accession NM\_025197) is another VGAM393 host target gene. CDK5RAP3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CDK5RAP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDK5RAP3 BINDING SITE, designated SEQ ID:24853, to the nucleotide sequence of VGAM393 RNA, herein designated VGAM RNA, also designated SEQ ID:3104.

[19281] Another function of VGAM393 is therefore inhibition of CDK5 Regulatory Subunit Associated Protein 3 (CDK5RAP3, Accession NM\_025197). Accordingly, utilities of VGAM393 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDK5RAP3. CXYorf1 (Accession XM\_088704) is another VGAM393 host target gene. CXYorf1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CXYorf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of CXYorf1 BINDING SITE, designated SEQ ID:39902, to the nucleotide sequence of VGAM393 RNA, herein designated VGAM RNA, also designated SEQ ID:3104.

[19282] Another function of VGAM393 is therefore inhibition of CXYorf1 (Accession XM\_088704). Accordingly, utilities of VGAM393 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXYorf1. FLJ12704 (Accession NM\_024998) is another VGAM393 host target gene. FLJ12704 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12704, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12704 BINDING SITE, designated SEQ ID:24562, to the nucleotide sequence of VGAM393 RNA, herein designated VGAM RNA, also designated SEQ ID:3104.

[19283] Another function of VGAM393 is therefore inhibition of FLJ12704 (Accession NM\_024998). Accordingly, utilities of VGAM393 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12704. HCA4 (Accession XM\_085287) is another VGAM393 host

target gene. HCA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HCA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCA4 BINDING SITE, designated SEQ ID:38026, to the nucleotide sequence of VGAM393 RNA, herein designated VGAM RNA, also designated SEQ ID:3104.

[19284] Another function of VGAM393 is therefore inhibition of HCA4 (Accession XM\_085287). Accordingly, utilities of VGAM393 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCA4. KIAA0427 (Accession NM\_014772) is another VGAM393 host target gene. KIAA0427 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0427, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0427 BINDING SITE, designated SEQ ID:16576, to the nucleotide sequence of VGAM393 RNA, herein designated VGAM RNA, also designated SEQ ID:3104.

[19285] Another function of VGAM393 is therefore inhibition of KIAA0427 (Accession NM\_014772). Accordingly, utilities of VGAM393 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0427. MSTP028 (Accession NM\_031954) is another VGAM393 host target gene. MSTP028 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MSTP028, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSTP028 BINDING SITE, designated SEQ ID:25695, to the nucleotide sequence of VGAM393 RNA, herein designated VGAM RNA, also designated SEQ ID:3104.

[19286] Another function of VGAM393 is therefore inhibition of MSTP028 (Accession NM\_031954). Accordingly, utilities of VGAM393 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSTP028. LOC120939 (Accession XM\_073688) is another VGAM393 host target gene. LOC120939 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC120939, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120939 BINDING SITE, designated SEQ ID:37514, to the nucleotide sequence of VGAM393 RNA, herein designated VGAM RNA, also designated SEQ ID:3104.

[19287] Another function of VGAM393 is therefore inhibition of LOC120939 (Accession XM\_073688). Accordingly, utilities of VGAM393 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120939. LOC149301 (Accession XM\_086480) is another VGAM393 host target gene. LOC149301 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149301 BINDING SITE, designated SEQ ID:38688, to the nucleotide sequence of VGAM393 RNA, herein designated VGAM RNA, also designated SEQ ID:3104.

[19288] Another function of VGAM393 is therefore inhibition of LOC149301 (Accession XM\_086480). Accordingly, utilities of VGAM393 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC149301. LOC152274 (Accession XM\_087418) is another VGAM393 host target gene. LOC152274 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152274, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152274 BINDING SITE, designated SEQ ID:39229, to the nucleotide sequence of VGAM393 RNA, herein designated VGAM RNA, also designated SEQ ID:3104.

[19289] Another function of VGAM393 is therefore inhibition of LOC152274 (Accession XM\_087418). Accordingly, utilities of VGAM393 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152274. LOC200093 (Accession XM\_032184) is another VGAM393 host target gene. LOC200093 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200093, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200093 BINDING SITE, designated SEQ ID:31594, to the nucleotide sequence of VGAM393 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3104.

[19290] Another function of VGAM393 is therefore inhibition of LOC200093 (Accession XM\_032184). Accordingly, utilities of VGAM393 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200093. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 394 (VGAM394) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19291] VGAM394 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM394 was detected is described hereinabove with reference to Figs. 1–8.

[19292] VGAM394 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria Hypovirus 1. VGAM394 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19293] VGAM394 gene encodes a VGAM394 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM394 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM394 precursor RNA is designated SEQ ID:380, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:380 is located at position 4060 relative to the genome of Cryphonectria Hypovirus 1.

[19294] VGAM394 precursor RNA folds onto itself, forming VGAM394 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19295] An enzyme complex designated DICER COMPLEX, `dices` the VGAM394 folded precursor RNA into VGAM394 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM394 RNA is designated SEQ ID:3105, and is provided hereinbelow with reference to the sequence listing part.

[19296] VGAM394 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM394 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM394 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19297] VGAM394 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM394 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM394 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM394 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM394 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19298] The complementary binding of VGAM394 RNA, herein designated VGAM RNA, to host target binding sites on VGAM394 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM394 host target RNA into VGAM394 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19299] It is appreciated that VGAM394 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM394 host target genes. The mRNA of

each one of this plurality of VGAM394 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM394 RNA, herein designated VGAM RNA, and which when bound by VGAM394 RNA causes inhibition of translation of respective one or more VGAM394 host target proteins.

[19300] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM394 gene, herein designated VGAM GENE, on one or more VGAM394 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[19301] It is yet further appreciated that a function of VGAM394 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM394 include diagnosis, prevention and treatment of viral infection by Cryphonectria Hypovirus 1. Specific functions, and accordingly utilities, of VGAM394 correlate with, and may be deduced from, the identity of the host target genes which VGAM394 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19302] Nucleotide sequences of the VGAM394 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM394 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM394 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM394 are further described hereinbelow with reference to Table 1.

[19303] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM394 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM394 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[19304] As mentioned hereinabove with reference to Fig. 1, a function of VGAM394 gene, herein designated VGAM is inhibition of expression of VGAM394 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM394 correlate with, and may be deduced from, the identity of the target genes which VGAM394 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19305] Aryl-hydrocarbon Receptor Nuclear Translocator 2 (ARNT2, Accession NM\_014862) is a VGAM394 host target gene. ARNT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARNT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARNT2 BINDING SITE, designated SEQ ID:16935, to the nucleotide sequence of VGAM394 RNA, herein designated VGAM RNA, also designated SEQ ID:3105.

[19306] A function of VGAM394 is therefore inhibition of Aryl-hydrocarbon Receptor Nuclear Translocator 2 (ARNT2, Ac-

cession NM\_014862), a gene which specifically recognizes the xenobiotic response element (xre). Accordingly, utilities of VGAM394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARNT2. The function of ARNT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM345. CRACC (Accession NM\_021181) is another VGAM394 host target gene. CRACC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CRACC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRACC BINDING SITE, designated SEQ ID:22155, to the nucleotide sequence of VGAM394 RNA, herein designated VGAM RNA, also designated SEQ ID:3105.

[19307] Another function of VGAM394 is therefore inhibition of CRACC (Accession NM\_021181), a gene which may participate in adhesion reactions between T lymphocytes and accessory cells. Accordingly, utilities of VGAM394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRACC. The function of

CRACC and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM26. DNA Fragmentation Factor, 40kDa, Beta Polypeptide (caspase-activated DNase) (DFFB, Accession XM\_113366) is another VGAM394 host target gene. DFFB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DFFB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DFFB BINDING SITE, designated SEQ ID:42241, to the nucleotide sequence of VGAM394 RNA, herein designated VGAM RNA, also designated SEQ ID:3105.

[19308] Another function of VGAM394 is therefore inhibition of DNA Fragmentation Factor, 40kDa, Beta Polypeptide (caspase-activated DNase) (DFFB, Accession XM\_113366), a gene which induces DNA fragmentation and chromatin condensation during apoptosis. Accordingly, utilities of VGAM394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DFFB. The function of DFFB and its association with various diseases and clinical conditions, has been established by previous

studies, as described hereinabove with reference to VGAM74. Glucose-6-phosphatase, Transport (glucose-6-phosphate) Protein 1 (G6PT1, Accession NM\_001467) is another VGAM394 host target gene. G6PT1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by G6PT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of G6PT1 BINDING SITE, designated SEQ ID:7201, to the nucleotide sequence of VGAM394 RNA, herein designated VGAM RNA, also designated SEQ ID:3105.

[19309] Another function of VGAM394 is therefore inhibition of Glucose-6-phosphatase, Transport (glucose-6-phosphate) Protein 1 (G6PT1, Accession NM\_001467). Accordingly, utilities of VGAM394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with G6PT1. Huntingtin (Huntington disease) (HD, Accession NM\_002111) is another VGAM394 host target gene. HD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HD BINDING SITE, designated SEQ ID:7894, to the nucleotide sequence of VGAM394 RNA, herein designated VGAM RNA, also designated SEQ ID:3105.

[19310] Another function of VGAM394 is therefore inhibition of Huntingtin (Huntington disease) (HD, Accession NM\_002111). Accordingly, utilities of VGAM394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HD. Vinculin (VCL, Accession NM\_003373) is another VGAM394 host target gene. VCL BINDING SITE1 and VCL BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by VCL, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VCL BINDING SITE1 and VCL BINDING SITE2, designated SEQ ID:9407 and SEQ ID:15196 respectively, to the nucleotide sequence of VGAM394 RNA, herein designated VGAM RNA, also designated SEQ ID:3105.

[19311] Another function of VGAM394 is therefore inhibition of Vinculin (VCL, Accession NM\_003373). Accordingly, utili-

ties of VGAM394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VCL. FLJ10815 (Accession NM\_018231) is another VGAM394 host target gene. FLJ10815 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10815, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10815 BINDING SITE, designated SEQ ID:20171, to the nucleotide sequence of VGAM394 RNA, herein designated VGAM RNA, also designated SEQ ID:3105.

[19312] Another function of VGAM394 is therefore inhibition of FLJ10815 (Accession NM\_018231). Accordingly, utilities of VGAM394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10815. FLJ20320 (Accession NM\_017765) is another VGAM394 host target gene. FLJ20320 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20320, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20320 BINDING SITE,

designated SEQ ID:19382, to the nucleotide sequence of VGAM394 RNA, herein designated VGAM RNA, also designated SEQ ID:3105.

[19313] Another function of VGAM394 is therefore inhibition of FLJ20320 (Accession NM\_017765). Accordingly, utilities of VGAM394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20320. FLJ23191 (Accession NM\_024574) is another VGAM394 host target gene. FLJ23191 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ23191, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23191 BINDING SITE, designated SEQ ID:23802, to the nucleotide sequence of VGAM394 RNA, herein designated VGAM RNA, also designated SEQ ID:3105.

[19314] Another function of VGAM394 is therefore inhibition of FLJ23191 (Accession NM\_024574). Accordingly, utilities of VGAM394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23191. KIAA0449 (Accession NM\_017596) is another VGAM394 host target gene. KIAA0449 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by KIAA0449, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0449 BINDING SITE, designated SEQ ID:19050, to the nucleotide sequence of VGAM394 RNA, herein designated VGAM RNA, also designated SEQ ID:3105.

[19315] Another function of VGAM394 is therefore inhibition of KIAA0449 (Accession NM\_017596). Accordingly, utilities of VGAM394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0449. TIP47 (Accession NM\_005817) is another VGAM394 host target gene. TIP47 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIP47, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIP47 BINDING SITE, designated SEQ ID:12417, to the nucleotide sequence of VGAM394 RNA, herein designated VGAM RNA, also designated SEQ ID:3105.

[19316] Another function of VGAM394 is therefore inhibition of

TIP47 (Accession NM\_005817). Accordingly, utilities of VGAM394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIP47.

LOC145757 (Accession XM\_085227) is another VGAM394 host target gene. LOC145757 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145757, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145757 BINDING SITE, designated SEQ ID:37969, to the nucleotide sequence of VGAM394 RNA, herein designated VGAM RNA, also designated SEQ ID:3105.

[19317] Another function of VGAM394 is therefore inhibition of LOC145757 (Accession XM\_085227). Accordingly, utilities of VGAM394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145757. LOC146481 (Accession XM\_085484) is another VGAM394 host target gene. LOC146481 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146481, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC146481 BINDING SITE, designated SEQ ID:38176, to the nucleotide sequence of VGAM394 RNA, herein designated VGAM RNA, also designated SEQ ID:3105.

[19318] Another function of VGAM394 is therefore inhibition of LOC146481 (Accession XM\_085484). Accordingly, utilities of VGAM394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146481. LOC90333 (Accession XM\_030958) is another VGAM394 host target gene. LOC90333 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90333 BINDING SITE, designated SEQ ID:31224, to the nucleotide sequence of VGAM394 RNA, herein designated VGAM RNA, also designated SEQ ID:3105.

[19319] Another function of VGAM394 is therefore inhibition of LOC90333 (Accession XM\_030958). Accordingly, utilities of VGAM394 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90333. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 395 (VGAM395) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19320] VGAM395 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM395 was detected is described hereinabove with reference to Figs. 1–8.

[19321] VGAM395 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria Hypovirus 1. VGAM395 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19322] VGAM395 gene encodes a VGAM395 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM395 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM395 precursor RNA is designated SEQ ID:381, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:381 is

located at position 9833 relative to the genome of Cryphonectria Hypovirus 1.

[19323] VGAM395 precursor RNA folds onto itself, forming VGAM395 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19324] An enzyme complex designated DICER COMPLEX, `dices` the VGAM395 folded precursor RNA into VGAM395 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM395 RNA is designated SEQ ID:3106, and is provided hereinbelow with reference to the sequence listing part.

[19325] VGAM395 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM395 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM395 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[19326] VGAM395 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM395 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM395 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM395 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM395 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[19327] The complementary binding of VGAM395 RNA, herein designated VGAM RNA, to host target binding sites on VGAM395 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM395 host target RNA into VGAM395 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19328] It is appreciated that VGAM395 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM395 host target genes. The mRNA of each one of this plurality of VGAM395 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM395 RNA, herein designated VGAM RNA, and which when bound by VGAM395 RNA causes inhibition of translation of respective one or more VGAM395

host target proteins.

[19329] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM395 gene, herein designated VGAM GENE, on one or more VGAM395 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[19330] It is yet further appreciated that a function of VGAM395 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM395 include diagnosis, prevention and treatment of viral infection by Cryphonectria Hypovirus 1.

Specific functions, and accordingly utilities, of VGAM395 correlate with, and may be deduced from, the identity of the host target genes which VGAM395 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [19331] Nucleotide sequences of the VGAM395 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM395 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM395 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM395 are further described hereinbelow with reference to Table 1.
- [19332] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM395 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM395 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [19333] As mentioned hereinabove with reference to Fig. 1, a function of VGAM395 gene, herein designated VGAM is inhibition of expression of VGAM395 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM395 correlate with, and may be deduced from, the identity of the target genes which VGAM395 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19334] G Protein-coupled Receptor Kinase-interactor 2 (GIT2, Accession NM\_014776) is a VGAM395 host target gene. GIT2 BINDING SITE1 through GIT2 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GIT2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GIT2 BINDING SITE1 through GIT2 BINDING SITE3, designated SEQ ID:16606, SEQ ID:27688 and SEQ ID:27701 respectively, to the nucleotide sequence of VGAM395 RNA, herein designated VGAM RNA, also designated SEQ ID:3106.

[19335] A function of VGAM395 is therefore inhibition of G Protein-coupled Receptor Kinase-interactor 2 (GIT2, Accession NM\_014776). Accordingly, utilities of VGAM395 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GIT2. Zinc Finger Protein 36, C3H Type-like 2 (ZFP36L2, Accession NM\_006887) is another VGAM395 host target gene.

ZFP36L2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZFP36L2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP36L2 BINDING SITE, designated SEQ ID:13752, to the nucleotide sequence of VGAM395 RNA, herein designated VGAM RNA, also designated SEQ ID:3106.

[19336] Another function of VGAM395 is therefore inhibition of Zinc Finger Protein 36, C3H Type-like 2 (ZFP36L2, Accession NM\_006887). Accordingly, utilities of VGAM395 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP36L2. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 396 (VGAM396) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19337] VGAM396 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM396 was detected is described

hereinabove with reference to Figs. 1–8.

[19338] VGAM396 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria Hypovirus 1. VGAM396 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19339] VGAM396 gene encodes a VGAM396 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM396 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM396 precursor RNA is designated SEQ ID:382, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:382 is located at position 2659 relative to the genome of Cryphonectria Hypovirus 1.

[19340] VGAM396 precursor RNA folds onto itself, forming VGAM396 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19341] An enzyme complex designated DICER COMPLEX, `dices` the VGAM396 folded precursor RNA into VGAM396 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM396 RNA is designated SEQ ID:3107, and is provided hereinbelow with reference to the sequence listing part.

[19342] VGAM396 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM396 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM396 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19343] VGAM396 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM396 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM396 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM396 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM396 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19344] The complementary binding of VGAM396 RNA, herein designated VGAM RNA, to host target binding sites on VGAM396 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM396 host target RNA into VGAM396 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19345] It is appreciated that VGAM396 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM396 host target genes. The mRNA of each one of this plurality of VGAM396 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM396 RNA, herein designated VGAM RNA, and which when bound by VGAM396 RNA causes inhibition of translation of respective one or more VGAM396 host target proteins.

[19346] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM396 gene, herein designated VGAM GENE, on one or more VGAM396 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[19347] It is yet further appreciated that a function of VGAM396 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM396 include diagnosis, prevention and treatment of viral infection by Cryphonectria Hypovirus 1. Specific functions, and accordingly utilities, of VGAM396 correlate with, and may be deduced from, the identity of the host target genes which VGAM396 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19348] Nucleotide sequences of the VGAM396 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM396 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM396 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM396 are further described hereinbelow with reference to Table 1.

[19349] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM396 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM396 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19350] As mentioned hereinabove with reference to Fig. 1, a function of VGAM396 gene, herein designated VGAM is inhibition of expression of VGAM396 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM396 correlate with, and may be deduced from, the identity of the target genes which VGAM396 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19351] Thy-1 Cell Surface Antigen (THY1, Accession NM\_006288) is a VGAM396 host target gene. THY1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by THY1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of THY1 BINDING SITE, designated SEQ ID:12975, to the nucleotide sequence of VGAM396 RNA, herein designated VGAM RNA, also designated SEQ ID:3107.

[19352] A function of VGAM396 is therefore inhibition of Thy-1 Cell Surface Antigen (THY1, Accession NM\_006288), a gene which plays a role in cell-cell or cell-ligand interactions during synaptogenesis. Accordingly, utilities of VGAM396 include diagnosis, prevention and treatment of diseases and clinical conditions associated with THY1. The function of THY1 has been established by previous studies. Thy-1 is the designation for a major cell surface glycoprotein characteristic to T cells, as first defined in the mouse and rat (Raff, 1971; Letarte-Muirhead et al., 1975). The Thy-1 glycoproteins are constituents of thymocytes and neurons and probably are involved in cell-cell interactions. The putative human homolog of Thy-1 of the mouse is called K117. The human homolog of the rodent antigen was studied by Ades et al. (1980). Using a monoclonal antibody, McKenzie and Fabre (1981) studied the tissue distribution of the antigen. By use of a gene clone in somatic cell hybrids, Seki et al. (1985) assigned the

THY1 gene to chromosome 11. Van den Elsen et al. (1985) predicted that the human Thy-1 homolog maps to chromosome 11 because that is where they found T3D (OMIM Ref. No. 186790) to map and in the mouse T3D and Thy-1 map to chromosome 9 along with certain other loci that are on human 11q. A multigene family is a group of homologous genes with similar function. A supergene family is a set of multigene families and single genes related by sequence (implying common ancestry) but not necessarily related in function. Hood et al. (1985) refer to the immunoglobulin supergene family which includes Thy-1, poly-Ig receptor, heavy, kappa and lambda immunoglobulins, Lyt-2 (T8), alpha and beta chains of T-cell antigen receptor and the closely homologous gamma chain, class I MHC antigen, beta-2-microglobulin, and the alpha and beta chains of class II MHC antigens. Thy-1 is structurally the simplest of these, consisting of a single immunoglobulin homology unit that is either intermediate between V and C or somewhat more similar to a V homology unit (Williams and Gagnon, 1982). The Thy-1 glycoprotein is also exceptional in that it is on the cell surface as a free homology unit and apparently does not associate either with itself or with other polypeptides. Its role in immune

response is unclear. It is expressed on fibroblasts and brain cells in addition to some T cells. The significant role of Thy-1 in developing nervous tissue (Morris, 1985) may be of relevance to disorders such as ataxia-telangiectasia (OMIM Ref. No. 208900) that combine neurologic and immunologic defects. By somatic cell and in situ hybridization, van Rijs et al. (1985) localized the gene to 11q23-11q24. Rettig et al. (1985) assigned the gene to 11q13-qter, by Southern analysis of DNA from hybrid cells containing rearranged chromosomes 11. HGM7 gave the regional assignment as 11q22.3. Tunnacliffe and McGuire (1990) constructed a physical map of 11q23 by pulsed field gel electrophoresis and showed that THY1 lies in 11q23.3 as the most telomeric of a group of 6 genes: cen--CD3E--CD3D--CD3G--PBGD--CBL2--THY1--qter. Greenspan and O'Brien (1989) showed in the mouse that a factor secreted by nonneuronal accessory cells of dorsal root ganglion cultures stimulates neurite outgrowth in neonatal sympathetic ganglion neurons. They presented evidence that this is identical to Thy-1. It is this function in separate tissues that might explain pleiotropic manifestations of some syndromes such as ataxia-telangiectasia (OMIM Ref. No. 208900) or cartilage-hair

hypoplasia (OMIM Ref. No. 250250).

[19353] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19354] Morris, R. : Thy-1 in developing nervous tissue. Dev. Neurosci. 7: 133-160, 1985. ; and

[19355] Greenspan, R. J.; O'Brien, M. C. : Genetic evidence for the role of Thy-1 in neurite outgrowth in the mouse. J. Neurogenet. 5: 25-36, 1989.

[19356] Further studies establishing the function and utilities of THY1 are found in John Hopkins OMIM database record ID 188230, and in cited publications numbered 9685-9690, 10262-9700, 88 and 10082-10084 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZp547I224 (Accession NM\_020221) is another VGAM396 host target gene. DKFZp547I224 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp547I224, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547I224 BINDING SITE, designated SEQ ID:21471, to the nucleotide sequence of

VGAM396 RNA, herein designated VGAM RNA, also designated SEQ ID:3107.

[19357] Another function of VGAM396 is therefore inhibition of DKFZp547I224 (Accession NM\_020221). Accordingly, utilities of VGAM396 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547I224. GTP Binding Protein 5 (putative) (GTPBP5, Accession XM\_037206) is another VGAM396 host target gene. GTPBP5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GTPBP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GTPBP5 BINDING SITE, designated SEQ ID:32576, to the nucleotide sequence of VGAM396 RNA, herein designated VGAM RNA, also designated SEQ ID:3107.

[19358] Another function of VGAM396 is therefore inhibition of GTP Binding Protein 5 (putative) (GTPBP5, Accession XM\_037206). Accordingly, utilities of VGAM396 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTPBP5. LOC145845 (Accession XM\_096884) is another VGAM396 host target

gene. LOC145845 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145845, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145845 BINDING SITE, designated SEQ ID:40615, to the nucleotide sequence of VGAM396 RNA, herein designated VGAM RNA, also designated SEQ ID:3107.

[19359] Another function of VGAM396 is therefore inhibition of LOC145845 (Accession XM\_096884). Accordingly, utilities of VGAM396 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145845. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 397 (VGAM397) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19360] VGAM397 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM397 was detected is described

hereinabove with reference to Figs. 1–8.

[19361] VGAM397 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria Hypovirus 1. VGAM397 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19362] VGAM397 gene encodes a VGAM397 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM397 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM397 precursor RNA is designated SEQ ID:383, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:383 is located at position 5663 relative to the genome of Cryphonectria Hypovirus 1.

[19363] VGAM397 precursor RNA folds onto itself, forming VGAM397 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed–reversed sequence of the nucleotide sequence of the second half thereof.

[19364] An enzyme complex designated DICER COMPLEX, `dices` the VGAM397 folded precursor RNA into VGAM397 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM397 RNA is designated SEQ ID:3108, and is provided hereinbelow with reference to the sequence listing part.

[19365] VGAM397 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM397 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM397 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19366] VGAM397 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM397 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM397 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM397 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM397 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19367] The complementary binding of VGAM397 RNA, herein designated VGAM RNA, to host target binding sites on VGAM397 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM397 host target RNA into VGAM397 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19368] It is appreciated that VGAM397 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM397 host target genes. The mRNA of each one of this plurality of VGAM397 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM397 RNA, herein designated VGAM RNA, and which when bound by VGAM397 RNA causes inhibition of translation of respective one or more VGAM397 host target proteins.

[19369] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM397 gene, herein designated VGAM GENE, on one or more VGAM397 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[19370] It is yet further appreciated that a function of VGAM397 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM397 include diagnosis, prevention and treatment of viral infection by Cryphonectria Hypovirus 1. Specific functions, and accordingly utilities, of VGAM397 correlate with, and may be deduced from, the identity of the host target genes which VGAM397 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19371] Nucleotide sequences of the VGAM397 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM397 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM397 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM397 are further described hereinbelow with reference to Table 1.

[19372] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM397 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM397 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19373] As mentioned hereinabove with reference to Fig. 1, a function of VGAM397 gene, herein designated VGAM is inhibition of expression of VGAM397 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM397 correlate with, and may be deduced from, the identity of the target genes which VGAM397 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19374] Solute Carrier Family 22 (organic cation transporter), Member 1-like Antisense (SLC22A1LS, Accession NM\_007105) is a VGAM397 host target gene. SLC22A1LS BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SLC22A1LS,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC22A1LS BINDING SITE, designated SEQ ID:13962, to the nucleotide sequence of VGAM397 RNA, herein designated VGAM RNA, also designated SEQ ID:3108.

[19375] A function of VGAM397 is therefore inhibition of Solute Carrier Family 22 (organic cation transporter), Member 1-like Antisense (SLC22A1LS, Accession NM\_007105), a gene which may function in the regulation of the ORCTL2 gene. Accordingly, utilities of VGAM397 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC22A1LS. The function of SLC22A1LS has been established by previous studies. Human chromosomal band 11p15.5 has been shown to contain genes involved in the development of several pediatric and adult tumors and in Beckwith-Wiedemann syndrome (BWS; 130650). Several genes in this region, including IGF2 (OMIM Ref. No. 147470), H19 (OMIM Ref. No. 103280), CDKN1C (OMIM Ref. No. 600856), IPL (TSSC3; 602131), and KVLQT1 (OMIM Ref. No. 192500), are known to undergo genomic imprinting. By genomic sequencing

of overlapping PAC clones from 11p15.5, followed by the identification of matching ESTs, Cooper et al. (1998) identified the organic-cation transporter-like-2 (ORCTL2; 602631) and ORCTL2-antisense (ORCTL2S) (GenBank AF037066) genes. Northern blot analysis indicated that these genes are predominantly expressed in fetal and adult liver and kidney. The ORCTL2 and ORCTL2S genes overlap in their 5-prime regions in divergent orientations, with the first exon of ORCTL2S sharing 31 bp with the second exon of ORCTL2. The ORCTL2S gene contains 4 exons spread over approximately 12 kb. It may have multiple transcription start sites or promoters. The largest open reading frame within the full-length ORCTL2S cDNA isolated by the authors encodes a putative 253-amino acid protein. Since ORCTL2S showed no significant similarity to DNA or protein sequences in the databases and lacks good matches to the Kozak and polyadenylation consensus sequences, Cooper et al. (1998) suggested that the ORCTL2S gene may not be translated and may function in the regulation of the ORCTL2 gene. The authors were unable to determine if the ORCTL2S gene is imprinted. They did not detect disease-associated mutations in the ORCTL2S genes of 62 Wilms tumor (WT; 194071)

patients or 10 BWS patients By genomic analysis of a 170-kb region at 11p15.5 between loci D11S601 and D11S679, Schwienbacher et al. (1998) identified 6 genes: NAP2 (OMIM Ref. No. 601651), CDKN1C, KVLQT1, BWR1A (ORCTL2, or SLC22A1L), BWR1B, and BWR1C (TSSC3), with BWR designating 'Beckwith–Wiedemann region.' Schwienbacher et al. (1998) cloned the full-length BWR1B cDNA from a human fetal liver cDNA library. The open reading frame encoded a protein of 253 amino acids with no significant homology to known proteins or motifs. Northern blot analysis revealed that the gene is expressed as a 1.2– to 1.3-kb mRNA most abundant in gastrointestinal tissues, but also detectable in kidney and placenta.

[19376] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [19377] Cooper, P. R.; Smilnich, N. J.; Day, C. D.; Nowak, N. J.; Reid, L. H.; Pearsall, R. S.; Reece, M.; Prawitt, D.; Landers, J.; Housman, D. E.; Winterpacht, A.; Zabel, B. U.; Pelletier, J.; Weissman, B. E.; Shows, T. B.; Higgins, M. J. : Divergently transcribed overlapping genes expressed in liver and kidney and located in the 11p15.5 imprinted domain. *Genomics* 49: 38–51, 1998. ; and
- [19378] Schwienbacher, C.; Sabbioni, S.; Campi, M.; Veronese, A.; Bernardi, G.; Menegatti, A.; Hatada, I.; Mukai, T.; Ohashi, H.; Barbanti-Brodano, G; Croce, C. M.; Negrini, M. : Transcriptional ma.
- [19379] Further studies establishing the function and utilities of SLC22A1LS are found in John Hopkins OMIM database record ID 603240, and in cited publications numbered 8748 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Rho/rac Guanine Nucleotide Exchange Factor (GEF) 2 (ARHGEF2, Accession NM\_004723) is another VGAM397 host target gene. ARHGEF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHGEF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of ARHGEF2 BINDING SITE, designated SEQ ID:11091, to the nucleotide sequence of VGAM397 RNA, herein designated VGAM RNA, also designated SEQ ID:3108.

[19380] Another function of VGAM397 is therefore inhibition of Rho/rac Guanine Nucleotide Exchange Factor (GEF) 2 (ARHGEF2, Accession NM\_004723). Accordingly, utilities of VGAM397 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF2. FLJ12681 (Accession NM\_022773) is another VGAM397 host target gene. FLJ12681 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12681, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12681 BINDING SITE, designated SEQ ID:23035, to the nucleotide sequence of VGAM397 RNA, herein designated VGAM RNA, also designated SEQ ID:3108.

[19381] Another function of VGAM397 is therefore inhibition of FLJ12681 (Accession NM\_022773). Accordingly, utilities of VGAM397 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12681.

FLJ30213 (Accession NM\_145008) is another VGAM397 host target gene. FLJ30213 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ30213, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ30213 BINDING SITE, designated SEQ ID:29608, to the nucleotide sequence of VGAM397 RNA, herein designated VGAM RNA, also designated SEQ ID:3108.

[19382] Another function of VGAM397 is therefore inhibition of FLJ30213 (Accession NM\_145008). Accordingly, utilities of VGAM397 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30213. LOC153688 (Accession XM\_098416) is another VGAM397 host target gene. LOC153688 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153688, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153688 BINDING SITE, designated SEQ ID:41651, to the nucleotide sequence of VGAM397 RNA, herein designated VGAM RNA,

also designated SEQ ID:3108.

[19383] Another function of VGAM397 is therefore inhibition of LOC153688 (Accession XM\_098416). Accordingly, utilities of VGAM397 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153688. LOC222066 (Accession XM\_166582) is another VGAM397 host target gene. LOC222066 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222066, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222066 BINDING SITE, designated SEQ ID:44552, to the nucleotide sequence of VGAM397 RNA, herein designated VGAM RNA, also designated SEQ ID:3108.

[19384] Another function of VGAM397 is therefore inhibition of LOC222066 (Accession XM\_166582). Accordingly, utilities of VGAM397 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222066. LOC91464 (Accession XM\_038589) is another VGAM397 host target gene. LOC91464 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91464, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91464 BINDING SITE, designated SEQ ID:32871, to the nucleotide sequence of VGAM397 RNA, herein designated VGAM RNA, also designated SEQ ID:3108.

[19385] Another function of VGAM397 is therefore inhibition of LOC91464 (Accession XM\_038589). Accordingly, utilities of VGAM397 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91464. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 398 (VGAM398) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19386] VGAM398 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM398 was detected is described hereinabove with reference to Figs. 1–8.

[19387] VGAM398 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria Hypovirus

1. VGAM398 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19388] VGAM398 gene encodes a VGAM398 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM398 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM398 precursor RNA is designated SEQ ID:384, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:384 is located at position 5176 relative to the genome of Cryphonectria Hypovirus 1.

[19389] VGAM398 precursor RNA folds onto itself, forming VGAM398 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19390] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM398 folded precursor RNA into VGAM398 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM398 RNA is designated SEQ ID:3109, and is provided hereinbelow with reference to the sequence listing part.

[19391] VGAM398 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM398 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM398 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19392] VGAM398 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM398 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM398 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM398 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM398 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19393] The complementary binding of VGAM398 RNA, herein designated VGAM RNA, to host target binding sites on VGAM398 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM398 host target RNA into VGAM398 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19394] It is appreciated that VGAM398 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM398 host target genes. The mRNA of each one of this plurality of VGAM398 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM398 RNA, herein designated VGAM RNA, and which when bound by VGAM398 RNA causes inhibition of translation of respective one or more VGAM398 host target proteins.

[19395] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM398 gene, herein designated VGAM GENE, on one or more VGAM398 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[19396] It is yet further appreciated that a function of VGAM398 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM398 include diagnosis, prevention and treatment of viral infection by Cryphonectria Hypovirus 1. Specific functions, and accordingly utilities, of VGAM398 correlate with, and may be deduced from, the identity of the host target genes which VGAM398 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19397] Nucleotide sequences of the VGAM398 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM398 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM398 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM398 are further described hereinbelow with reference to Table 1.

[19398] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM398 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM398 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19399] As mentioned hereinabove with reference to Fig. 1, a function of VGAM398 gene, herein designated VGAM is inhibition of expression of VGAM398 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM398 correlate with, and may be deduced from, the identity of the target genes which VGAM398 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19400] Cytochrome P450, Subfamily 46 (cholesterol 24-hydroxylase) (CYP46, Accession NM\_006668) is a VGAM398 host target gene. CYP46 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYP46, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP46 BINDING SITE,

designated SEQ ID:13483, to the nucleotide sequence of VGAM398 RNA, herein designated VGAM RNA, also designated SEQ ID:3109.

[19401] A function of VGAM398 is therefore inhibition of Cytochrome P450, Subfamily 46 (cholesterol 24-hydroxylase) (CYP46, Accession NM\_006668). Accordingly, utilities of VGAM398 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP46. RalA Binding Protein 1 (RALBP1, Accession NM\_006788) is another VGAM398 host target gene. RALBP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RALBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RALBP1 BINDING SITE, designated SEQ ID:13663, to the nucleotide sequence of VGAM398 RNA, herein designated VGAM RNA, also designated SEQ ID:3109.

[19402] Another function of VGAM398 is therefore inhibition of RalA Binding Protein 1 (RALBP1, Accession NM\_006788), a gene which plays a role in signal transduction and catalyzes the transport of glutathione conjugates and xeno-

biotics. Accordingly, utilities of VGAM398 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RALBP1. The function of RALBP1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM345. Chromosome 22 Open Reading Frame 19 (C22orf19, Accession NM\_003678) is another VGAM398 host target gene. C22orf19 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C22orf19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C22orf19 BINDING SITE, designated SEQ ID:9775, to the nucleotide sequence of VGAM398 RNA, herein designated VGAM RNA, also designated SEQ ID:3109.

[19403] Another function of VGAM398 is therefore inhibition of Chromosome 22 Open Reading Frame 19 (C22orf19, Accession NM\_003678). Accordingly, utilities of VGAM398 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C22orf19. Fig. 1 further provides a conceptual description of a novel bioin-

formatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 399 (VGAM399) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19404] VGAM399 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM399 was detected is described hereinabove with reference to Figs. 1–8.

[19405] VGAM399 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria Hypovirus 1. VGAM399 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19406] VGAM399 gene encodes a VGAM399 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM399 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM399 precursor RNA is designated SEQ ID:385, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:385 is located at position 2559 relative to the genome of Cry–

phonectria Hypovirus 1.

[19407] VGAM399 precursor RNA folds onto itself, forming VGAM399 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19408] An enzyme complex designated DICER COMPLEX, `dices` the VGAM399 folded precursor RNA into VGAM399 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM399 RNA is designated SEQ ID:3110, and is provided hereinbelow with reference to the sequence listing part.

[19409] VGAM399 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM399 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM399 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19410] VGAM399 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM399 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM399 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM399 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM399 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19411] The complementary binding of VGAM399 RNA, herein designated VGAM RNA, to host target binding sites on VGAM399 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM399 host target RNA into VGAM399 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19412] It is appreciated that VGAM399 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM399 host target genes. The mRNA of each one of this plurality of VGAM399 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM399 RNA, herein designated VGAM RNA, and which when bound by VGAM399 RNA causes inhibition of translation of respective one or more VGAM399 host target proteins.

[19413] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM399 gene, herein designated VGAM GENE, on one or more VGAM399 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[19414] It is yet further appreciated that a function of VGAM399 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM399 include diagnosis, prevention and treatment of viral infection by Cryphonectria Hypovirus 1. Specific functions, and accordingly utilities, of VGAM399

correlate with, and may be deduced from, the identity of the host target genes which VGAM399 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19415] Nucleotide sequences of the VGAM399 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM399 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM399 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM399 are further described hereinbelow with reference to Table 1.

[19416] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM399 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM399 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19417] As mentioned hereinabove with reference to Fig. 1, a function of VGAM399 gene, herein designated VGAM is inhibition of expression of VGAM399 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM399 correlate with, and may be deduced

from, the identity of the target genes which VGAM399 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19418] Deleted In Azoospermia-like (DAZL, Accession XM\_042839) is a VGAM399 host target gene. DAZL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAZL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAZL BINDING SITE, designated SEQ ID:33802, to the nucleotide sequence of VGAM399 RNA, herein designated VGAM RNA, also designated SEQ ID:3110.

[19419] A function of VGAM399 is therefore inhibition of Deleted In Azoospermia-like (DAZL, Accession XM\_042839), a gene which may be essential for gametogenesis. Accordingly, utilities of VGAM399 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAZL. The function of DAZL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM206. Exonuclease 1 (EXO1, Accession NM\_130398) is another VGAM399 host target gene.

EXO1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EXO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EXO1 BINDING SITE, designated SEQ ID:28181, to the nucleotide sequence of VGAM399 RNA, herein designated VGAM RNA, also designated SEQ ID:3110.

[19420] Another function of VGAM399 is therefore inhibition of Exonuclease 1 (EXO1, Accession NM\_130398), a gene which excise and replace mismatched segments. Accordingly, utilities of VGAM399 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EXO1. The function of EXO1 has been established by previous studies. Mutation rates in normal cells are low due to the existence of DNA repair systems in which exonucleases, endonucleases, and helicases excise and replace mismatched segments. By searching an EST database for homologs of the yeast Exo1 gene, Wilson et al. (1998) identified a cDNA encoding human EXO1, which they termed HEX1. Sequence analysis predicted that the 803-amino acid human protein, which is 26% identical to the yeast protein, contains 2 potential nuclear localization

signals, one in its central region and the other in its C-terminal region. Functional analysis indicated that EXO1 has exonuclease activity with a 5-prime-to-3-prime polarity. Northern blot analysis revealed high expression of an approximately 4.0-kb transcript in fetal liver and adult bone marrow, with low levels in other tissues, suggesting that EXO1 may function prominently in DNA metabolic processes occurring during stem cell differentiation.

Schmutte et al. (1998) cloned EXO1, which they predicted encodes an 846-amino acid protein. GST pull-down analysis determined that EXO1 interacts with MSH2 (OMIM Ref. No. 120435), which is involved in susceptibility to familial nonpolyposis colon cancer. Tishkoff et al. (1998) cloned EXO1 and showed that it encodes 2 splice variants, EXO1A and EXO1B, that share the first 802 residues and have C-terminal extensions of 1 and 44 amino acids, respectively. Northern blot analysis detected wide expression of a 3.0-kb transcript, with significantly higher expression in testis, and elevated expression in thymus, colon, and placenta. By FISH, Wilson et al. (1998) mapped the EXO1 gene to 1q42-q43.

[19421] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [19422] Wilson, D. M., III; Carney, J. P.; Coleman, M. A.; Adamson, A. W.; Christensen, M.; Lamerdin, J. E. : Hex1: a new human Rad2 nuclease family member with homology to yeast exonuclease 1. *Nucleic Acids Res.* 26: 3762–3768, 1998. ; and
- [19423] Tishkoff, D. X.; Amin, N. S.; Viars, C. S.; Arden, K. C.; Kolodner, R. D. : Identification of a human gene encoding a homologue of *Saccharomyces cerevisiae* EXO1, an exonuclease implicate.
- [19424] Further studies establishing the function and utilities of EXO1 are found in John Hopkins OMIM database record ID 606063, and in cited publications numbered 6903–6906 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Folate Receptor 1 (adult) (FOLR1, Accession NM\_016730) is another VGAM399 host target gene. FOLR1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FOLR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FOLR1 BINDING SITE, designated SEQ ID:18782, to the nucleotide sequence of

VGAM399 RNA, herein designated VGAM RNA, also designated SEQ ID:3110.

[19425] Another function of VGAM399 is therefore inhibition of Folate Receptor 1 (adult) (FOLR1, Accession NM\_016730), a gene which binds and initiates transport of folate and methotrexate. Accordingly, utilities of VGAM399 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOLR1. The function of FOLR1 has been established by previous studies. To identify cellular entry factors employed by the Marburg (MBG) virus, Chan et al. (2001) used noninfectible cells transfected with an expression library and challenged them with a selectable pseudotype virus packaged by MBG glycoproteins. A cDNA encoding FOLR1 was recovered from cells exhibiting reconstitution of viral entry. A FOLR1 cDNA was also recovered in a similar strategy employing Ebola (EBO) pseudotypes. FOLR1 expression in Jurkat cells facilitated MBG or EBO entry, and FR-blocking reagents inhibited infection by MBG or EBO. Finally, FOLR1 bound cells expressing MBG or EBO glycoproteins and mediated syncytia formation triggered by MBG glycoproteins. The authors concluded that FOLR1 is a significant cofactor for cellular entry for MBG and EBO viruses. Animal model ex-

periments lend further support to the function of FOLR1. Periconceptional folic acid supplementation reduces the occurrence of several human congenital malformations, including craniofacial, heart, and neural tube defects (Czeizel and Dudas, 1992; Werler et al., 1993; Shaw et al., 1994). Although the underlying mechanism is unknown, there may be a maternal-to-fetal folate transport defect or an inherent fetal biochemical disorder that is neutralized by supplementation. To determine whether folic acid-binding protein-1 is involved in maternal-to-fetal folate transport, Piedrahita et al. (1999) inactivated the gene (symbolized *Folbp1* in that species) in mice. They also produced mice lacking *Folbp2* (FOLR2; 136425), another member of the folate receptor family that is GPI-anchored but binds folate poorly. *Folbp2*  $-/-$  embryos developed normally, but *Folbp1*  $-/-$  embryos had severe morphogenetic abnormalities and died in utero by embryonic day 10. Supplementing pregnant *Folbp1*  $+/-$  dams with folic acid reversed this phenotype in nullizygous pups. The results suggested that *Folbp1* has a critical role in folate homeostasis during development, and that functional defects in the human homolog, FOLR1, may contribute to similar defects in humans.

[19426] It is appreciated that the abovementioned animal model for FOLR1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[19427] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19428] Chan, S. Y.; Empig, C. J.; Welte, F. J.; Speck, R. F.; Schmaljohn, A.; Kreisberg, J. F.; Goldsmith, M. A. : Folate receptor- $\alpha$  is a cofactor for cellular entry by Marburg and Ebola viruses. *Cell* 106: 117–126, 2001. ; and

[19429] Piedrahita, J. A.; Oetama, B.; Bennett, G. D.; van Waes, J.; Kamen, B. A.; Richardson, J.; Lacey, S. W.; Anderson, R. G. W.; Finnell, R. H. : Mice lacking the folic acid-binding protein.

[19430] Further studies establishing the function and utilities of FOLR1 are found in John Hopkins OMIM database record ID 136430, and in cited publications numbered 11715–11717, 11877–11881, 3591, 359 and 11714–3595 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein Phosphatase 2 (formerly 2A), Catalytic Subunit, Alpha Isoform (PPP2CA, Accession NM\_002715) is

another VGAM399 host target gene. PPP2CA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP2CA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP2CA BINDING SITE, designated SEQ ID:8581, to the nucleotide sequence of VGAM399 RNA, herein designated VGAM RNA, also designated SEQ ID:3110.

[19431] Another function of VGAM399 is therefore inhibition of Protein Phosphatase 2 (formerly 2A), Catalytic Subunit, Alpha Isoform (PPP2CA, Accession NM\_002715), a gene which plays a role in the regulation of most major metabolic pathways. Accordingly, utilities of VGAM399 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP2CA. The function of PPP2CA has been established by previous studies. Protein phosphorylation, a crucial posttranslational modification step controlling many diverse cellular functions, is dependent on the opposing actions of protein kinases and protein phosphatases. The enzyme protein phosphatase 2A is 1 of 4 major protein phosphatases identified in the cytosol of eukaryotic cells which are responsible for the

dephosphorylation of serine and threonine residues in proteins. Although all 4 protein phosphatases, PP1, PP2A, PP2B, and PP2C, have overlapping substrate specificities in vitro, they can be distinguished by the use of inhibitor proteins and by their dependence on metal ions. PP1 is inhibited by nanomolar concentrations of 2 thermostable proteins, inhibitor 1 and inhibitor 2, whereas the type 2 phosphatases are unaffected by these inhibitors. The type 2 phosphatases can be distinguished by how their activity is regulated: PP2A activity is independent of metal ions, PP2B is activated by  $\text{Ca}^{2+}$ /calmodulin, and PP2C is activated by  $\text{Mg}^{2+}$  (Cohen and Cohen, 1989). Protein phosphatase 2A appears to play a role in the regulation of most major metabolic pathways, as well as translation, transcription, and control of transition from G2 to the M phase of the cell cycle. PP2A may function as either a tumor promoter or tumor suppressor, depending on the cell type or the transforming agent. The mammalian enzyme can be isolated as a catalytic subunit of 36 kD complexed to 1 regulatory subunit of 65 kD and to another regulatory subunit of varying molecular mass, depending on the tissue and the separation technique used. Two isoforms of the catalytic subunit of PP2A, alpha and beta (OMIM Ref.

No. 176916), are demonstrable in many mammalian species. The structures of these catalytic subunits show the highest evolutionary conservation of all known enzymes, supporting the idea that they may serve crucial functions. Stone et al. (1988) isolated the human cDNA for the PPP2CA subunit from lung and lung fibroblast libraries. The cDNA encodes a 309-amino acid polypeptide. Groves et al. (1999) reported that the crystal structure of the PPP2CA subunit at 2.3-angstrom resolution revealed the conformation of its 15 tandemly repeated 'heat' sequences, degenerate motifs of 39 amino acids present in a variety of proteins, including huntingtin (OMIM Ref. No. 143100) and importin-beta (see OMIM Ref. No. 602738). Individual motifs are composed of a pair of antiparallel alpha-helices that assemble in a mainly linear, repetitive fashion to form an elongated molecule characterized by a double layer of alpha-helices. The protein interaction interface is formed from the intrarepeat turns that are aligned to form a continuous ridge.

[19432] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19433] Cohen, P.; Cohen, P. T. W. : Protein phosphatases come of

age. J. Biol. Chem. 264: 21435–21438, 1989. ; and

[19434] Groves, M. R.; Hanlon, N.; Turowski, P.; Hemmings, B. A.; Barford, D. : The structure of the protein phosphatase 2A PR65/A subunit reveals the conformation of its 15 tandemly repeated HE.

[19435] Further studies establishing the function and utilities of PPP2CA are found in John Hopkins OMIM database record ID 176915, and in cited publications numbered 2522–2525 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. TAR (HIV) RNA Binding Protein 2 (TARBP2, Accession NM\_134324) is another VGAM399 host target gene. TARBP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TARBP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TARBP2 BINDING SITE, designated SEQ ID:28626, to the nucleotide sequence of VGAM399 RNA, herein designated VGAM RNA, also designated SEQ ID:3110.

[19436] Another function of VGAM399 is therefore inhibition of TAR (HIV) RNA Binding Protein 2 (TARBP2, Accession NM\_134324), a gene which is involved in the regulation of

HIV replication. Accordingly, utilities of VGAM399 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TARBP2. The function of TARBP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM95.FLJ20136 (Accession NM\_017684) is another VGAM399 host target gene. FLJ20136 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20136, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20136 BINDING SITE, designated SEQ ID:19233, to the nucleotide sequence of VGAM399 RNA, herein designated VGAM RNA, also designated SEQ ID:3110.

[19437] Another function of VGAM399 is therefore inhibition of FLJ20136 (Accession NM\_017684). Accordingly, utilities of VGAM399 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20136. KIAA0433 (Accession NM\_015216) is another VGAM399 host target gene. KIAA0433 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by KIAA0433, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0433 BINDING SITE, designated SEQ ID:17545, to the nucleotide sequence of VGAM399 RNA, herein designated VGAM RNA, also designated SEQ ID:3110.

[19438] Another function of VGAM399 is therefore inhibition of KIAA0433 (Accession NM\_015216). Accordingly, utilities of VGAM399 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0433. KIAA0446 (Accession XM\_044155) is another VGAM399 host target gene. KIAA0446 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0446, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0446 BINDING SITE, designated SEQ ID:34143, to the nucleotide sequence of VGAM399 RNA, herein designated VGAM RNA, also designated SEQ ID:3110.

[19439] Another function of VGAM399 is therefore inhibition of KIAA0446 (Accession XM\_044155). Accordingly, utilities

of VGAM399 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0446. KIAA1826 (Accession XM\_040784) is another VGAM399 host target gene. KIAA1826 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1826, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1826 BINDING SITE, designated SEQ ID:33375, to the nucleotide sequence of VGAM399 RNA, herein designated VGAM RNA, also designated SEQ ID:3110.

[19440] Another function of VGAM399 is therefore inhibition of KIAA1826 (Accession XM\_040784). Accordingly, utilities of VGAM399 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1826. Kinesin Family Member 13B (KIF13B, Accession XM\_096266) is another VGAM399 host target gene. KIF13B BINDING SITE1 and KIF13B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIF13B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the comple-

mentarity of the nucleotide sequences of KIF13B BINDING SITE1 and KIF13B BINDING SITE2, designated SEQ ID:40309 and SEQ ID:17581 respectively, to the nucleotide sequence of VGAM399 RNA, herein designated VGAM RNA, also designated SEQ ID:3110.

[19441] Another function of VGAM399 is therefore inhibition of Kinesin Family Member 13B (KIF13B, Accession XM\_096266). Accordingly, utilities of VGAM399 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIF13B. LOC253675 (Accession XM\_172990) is another VGAM399 host target gene. LOC253675 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253675, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253675 BINDING SITE, designated SEQ ID:46262, to the nucleotide sequence of VGAM399 RNA, herein designated VGAM RNA, also designated SEQ ID:3110.

[19442] Another function of VGAM399 is therefore inhibition of LOC253675 (Accession XM\_172990). Accordingly, utilities of VGAM399 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC253675. LOC255919 (Accession XM\_170794) is another VGAM399 host target gene. LOC255919 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255919, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255919 BINDING SITE, designated SEQ ID:45557, to the nucleotide sequence of VGAM399 RNA, herein designated VGAM RNA, also designated SEQ ID:3110.

[19443] Another function of VGAM399 is therefore inhibition of LOC255919 (Accession XM\_170794). Accordingly, utilities of VGAM399 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255919. LOC91012 (Accession XM\_035503) is another VGAM399 host target gene. LOC91012 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91012, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91012 BINDING SITE, designated SEQ ID:32279, to the

nucleotide sequence of VGAM399 RNA, herein designated VGAM RNA, also designated SEQ ID:3110.

[19444] Another function of VGAM399 is therefore inhibition of LOC91012 (Accession XM\_035503). Accordingly, utilities of VGAM399 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91012. LOC92539 (Accession XM\_045632) is another VGAM399 host target gene. LOC92539 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92539, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92539 BINDING SITE, designated SEQ ID:34496, to the nucleotide sequence of VGAM399 RNA, herein designated VGAM RNA, also designated SEQ ID:3110.

[19445] Another function of VGAM399 is therefore inhibition of LOC92539 (Accession XM\_045632). Accordingly, utilities of VGAM399 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92539. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 400 (VGAM400) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19446] VGAM400 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM400 was detected is described hereinabove with reference to Figs. 1–8.

[19447] VGAM400 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria Hypovirus 1. VGAM400 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19448] VGAM400 gene encodes a VGAM400 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM400 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM400 precursor RNA is designated SEQ ID:386, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:386 is located at position 4214 relative to the genome of Cryphonectria Hypovirus 1.

[19449] VGAM400 precursor RNA folds onto itself, forming VGAM400 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19450] An enzyme complex designated DICER COMPLEX, `dices` the VGAM400 folded precursor RNA into VGAM400 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM400 RNA is designated SEQ ID:3111, and is provided hereinbelow with reference to the sequence listing part.

[19451] VGAM400 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM400 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM400 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19452] VGAM400 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM400 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM400 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM400 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM400 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19453] The complementary binding of VGAM400 RNA, herein designated VGAM RNA, to host target binding sites on VGAM400 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM400 host target RNA into VGAM400 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19454] It is appreciated that VGAM400 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM400 host target genes. The mRNA of each one of this plurality of VGAM400 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM400 RNA, herein designated VGAM RNA, and which when bound by VGAM400 RNA causes inhibition of translation of respective one or more VGAM400 host target proteins.

[19455] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM400 gene, herein designated VGAM GENE, on one or more VGAM400 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[19456] It is yet further appreciated that a function of VGAM400 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM400 include diagnosis, prevention and treatment of viral infection by Cryphonectria Hypovirus 1. Specific functions, and accordingly utilities, of VGAM400 correlate with, and may be deduced from, the identity of

the host target genes which VGAM400 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19457] Nucleotide sequences of the VGAM400 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM400 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM400 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM400 are further described hereinbelow with reference to Table 1.

[19458] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM400 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM400 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19459] As mentioned hereinabove with reference to Fig. 1, a function of VGAM400 gene, herein designated VGAM is inhibition of expression of VGAM400 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM400 correlate with, and may be deduced from, the identity of the target genes which VGAM400

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19460] Collagen, Type IV, Alpha 6 (COL4A6, Accession NM\_001847) is a VGAM400 host target gene. COL4A6 BINDING SITE1 and COL4A6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by COL4A6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL4A6 BINDING SITE1 and COL4A6 BINDING SITE2, designated SEQ ID:7581 and SEQ ID:27357 respectively, to the nucleotide sequence of VGAM400 RNA, herein designated VGAM RNA, also designated SEQ ID:3111.

[19461] A function of VGAM400 is therefore inhibition of Collagen, Type IV, Alpha 6 (COL4A6, Accession NM\_001847). Accordingly, utilities of VGAM400 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL4A6. LOC154084 (Accession XM\_098468) is another VGAM400 host target gene. LOC154084 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC154084, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154084 BINDING SITE, designated SEQ ID:41684, to the nucleotide sequence of VGAM400 RNA, herein designated VGAM RNA, also designated SEQ ID:3111.

[19462] Another function of VGAM400 is therefore inhibition of LOC154084 (Accession XM\_098468). Accordingly, utilities of VGAM400 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154084. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 401 (VGAM401) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19463] VGAM401 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM401 was detected is described hereinabove with reference to Figs. 1–8.

[19464] VGAM401 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria Hypovirus

1. VGAM401 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19465] VGAM401 gene encodes a VGAM401 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM401 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM401 precursor RNA is designated SEQ ID:387, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:387 is located at position 11685 relative to the genome of Cryphonectria Hypovirus 1.

[19466] VGAM401 precursor RNA folds onto itself, forming VGAM401 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19467] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM401 folded precursor RNA into VGAM401 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM401 RNA is designated SEQ ID:3112, and is provided hereinbelow with reference to the sequence listing part.

[19468] VGAM401 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM401 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM401 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19469] VGAM401 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM401 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM401 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM401 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM401 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[19470] The complementary binding of VGAM401 RNA, herein designated VGAM RNA, to host target binding sites on VGAM401 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM401 host target RNA into VGAM401 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19471] It is appreciated that VGAM401 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM401 host target genes. The mRNA of each one of this plurality of VGAM401 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM401 RNA, herein designated VGAM RNA, and which when bound by VGAM401 RNA causes inhibition of translation of respective one or more VGAM401 host target proteins.

[19472] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM401 gene, herein designated VGAM GENE, on one or more VGAM401 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[19473] It is yet further appreciated that a function of VGAM401 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM401 include diagnosis, prevention and treatment of viral infection by Cryphonectria Hypovirus 1. Specific functions, and accordingly utilities, of VGAM401 correlate with, and may be deduced from, the identity of the host target genes which VGAM401 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19474] Nucleotide sequences of the VGAM401 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM401 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM401 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM401 are further described hereinbelow with reference to Table 1.

- [19475] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM401 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM401 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [19476] As mentioned hereinabove with reference to Fig. 1, a function of VGAM401 gene, herein designated VGAM is inhibition of expression of VGAM401 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM401 correlate with, and may be deduced from, the identity of the target genes which VGAM401 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [19477] V-akt Murine Thymoma Viral Oncogene Homolog 1 (AKT1, Accession NM\_005163) is a VGAM401 host target gene. AKT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AKT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKT1 BINDING SITE, designated SEQ ID:11654,

to the nucleotide sequence of VGAM401 RNA, herein designated VGAM RNA, also designated SEQ ID:3112.

[19478] A function of VGAM401 is therefore inhibition of V-akt Murine Thymoma Viral Oncogene Homolog 1 (AKT1, Accession NM\_005163), a gene which Serine-threonine protein kinase. Accordingly, utilities of VGAM401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKT1. The function of AKT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM188.ATPase, Cu++ Transporting, Alpha Polypeptide (Menkes syndrome) (ATP7A, Accession NM\_000052) is another VGAM401 host target gene. ATP7A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP7A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP7A BINDING SITE, designated SEQ ID:5501, to the nucleotide sequence of VGAM401 RNA, herein designated VGAM RNA, also designated SEQ ID:3112.

[19479] Another function of VGAM401 is therefore inhibition of

ATPase, Cu++ Transporting, Alpha Polypeptide (Menkes syndrome) (ATP7A, Accession NM\_000052). Accordingly, utilities of VGAM401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP7A. Cas-Br-M (murine) Ecotropic Retroviral Transforming Sequence B (CBLB, Accession NM\_004351) is another VGAM401 host target gene. CBLB BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CBLB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBLB BINDING SITE, designated SEQ ID:10553, to the nucleotide sequence of VGAM401 RNA, herein designated VGAM RNA, also designated SEQ ID:3112.

[19480] Another function of VGAM401 is therefore inhibition of Cas-Br-M (murine) Ecotropic Retroviral Transforming Sequence B (CBLB, Accession NM\_004351), a gene which SH3 binding protein with similarity to human CBL; interacts and regulates signal transduction proteins. Accordingly, utilities of VGAM401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBLB. The function of CBLB has been established

by previous studies. The autoimmune disease type 1 diabetes mellitus, also known as insulin-dependent diabetes mellitus (IDDM; 222100), has a multifactorial etiology. The major histocompatibility complex (MHC) has been identified as a major susceptibility locus in the disease and its animal models. The Komeda diabetes-prone (KDP) rat is a spontaneous animal model of human type 1 diabetes (Komeda et al., 1998) in which the major susceptibility locus Iddm/kdp1 accounts, in combination with MHC, for most of the genetic predisposition to diabetes. Yokoi et al. (2002) reported positional cloning of Iddm/kdp1 and identification of a nonsense mutation in Cblb. Lymphocytes of the KDP rat infiltrate pancreatic islets and several tissues including thyroid gland and kidney, indicating autoimmunity. Similar findings in Cblb-deficient mice are caused by enhanced T-cell activation. Transgenic complementation with wildtype Cblb significantly suppressed development of the KDP phenotype. Thus, Cblb functions as a negative regulator of autoimmunity and Cblb is a major susceptibility gene for type 1 diabetes in the rat. Yokoi et al. (2002) concluded that impairment of the Cblb signaling pathway may contribute to human autoimmune diseases, including type 1 diabetes. Animal model experi-

ments lend further support to the function of CBLB. Bachmaier et al. (2000) generated mice deficient in CBLB by targeted disruption. At 6 months of age, these mice, which were maintained under specific pathogen-free conditions, exhibited a huge mass in submandibular salivary glands which resulted from accumulations of T and B cells and lymphoid neoorganogenesis. Mononuclear cells also accumulated in and damaged multiple organs and tissues, although the enlargement was only slight in spleen and lymph nodes. In CBLB +/- mice, the authors detected minor infiltration in only the submandibular salivary glands and kidneys. Measurement of a number of in vitro parameters demonstrated hyperproliferation of T and B cells as well as hyperproduction of IL2 but not of IFNG (OMIM Ref. No. 147570) or TNFA (OMIM Ref. No. 191160).

[19481] It is appreciated that the abovementioned animal model for CBLB is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[19482] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19483] Yokoi, N.; Komeda, K.; Wang, H.-Y.; Yano, H.; Kitada, K.;

Saitoh, Y.; Seino, Y.; Yasuda, K.; Serikawa, T.; Seino, S. :  
Cblb is a major susceptibility gene for rat type 1 diabetes  
mellitus. Nature Genet. 31: 391–394, 2002. ; and

Sarosi, I.;

[19485] Further studies establishing the function and utilities of  
CBLB are found in John Hopkins OMIM database record ID  
604491, and in cited publications numbered 4751–4755  
listed in the bibliography section hereinbelow, which are  
also hereby incorporated by reference. Optic Atrophy 1  
(autosomal dominant) (OPA1, Accession NM\_130833) is  
another VGAM401 host target gene. OPA1 BINDING SITE1  
through OPA1 BINDING SITE5 are HOST TARGET binding  
sites found in untranslated regions of mRNA encoded by  
OPA1, corresponding to HOST TARGET binding sites such  
as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-  
ble 2 illustrates the complementarity of the nucleotide se-  
quences of OPA1 BINDING SITE1 through OPA1 BINDING  
SITE5, designated SEQ ID:28325, SEQ ID:28333, SEQ  
ID:28341, SEQ ID:28349 and SEQ ID:28357 respectively,  
to the nucleotide sequence of VGAM401 RNA, herein des-

ignated VGAM RNA, also designated SEQ ID:3112.

[19486] Another function of VGAM401 is therefore inhibition of Optic Atrophy 1 (autosomal dominant) (OPA1, Accession NM\_130833). Accordingly, utilities of VGAM401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OPA1. DKFZP434P1750 (Accession NM\_015527) is another VGAM401 host target gene. DKFZP434P1750 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434P1750, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434P1750 BINDING SITE, designated SEQ ID:17794, to the nucleotide sequence of VGAM401 RNA, herein designated VGAM RNA, also designated SEQ ID:3112.

[19487] Another function of VGAM401 is therefore inhibition of DKFZP434P1750 (Accession NM\_015527). Accordingly, utilities of VGAM401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434P1750. HCA3 (Accession NM\_138703) is another VGAM401 host target gene. HCA3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by HCA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCA3 BINDING SITE, designated SEQ ID:28951, to the nucleotide sequence of VGAM401 RNA, herein designated VGAM RNA, also designated SEQ ID:3112.

[19488] Another function of VGAM401 is therefore inhibition of HCA3 (Accession NM\_138703). Accordingly, utilities of VGAM401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCA3. KIAA0876 (Accession XM\_035625) is another VGAM401 host target gene. KIAA0876 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0876, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0876 BINDING SITE, designated SEQ ID:32300, to the nucleotide sequence of VGAM401 RNA, herein designated VGAM RNA, also designated SEQ ID:3112.

[19489] Another function of VGAM401 is therefore inhibition of KIAA0876 (Accession XM\_035625). Accordingly, utilities

of VGAM401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0876. MGC12981 (Accession NM\_032357) is another VGAM401 host target gene. MGC12981 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC12981, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12981 BINDING SITE, designated SEQ ID:26143, to the nucleotide sequence of VGAM401 RNA, herein designated VGAM RNA, also designated SEQ ID:3112.

[19490] Another function of VGAM401 is therefore inhibition of MGC12981 (Accession NM\_032357). Accordingly, utilities of VGAM401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12981. NAG14 (Accession NM\_022143) is another VGAM401 host target gene. NAG14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NAG14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NAG14 BINDING SITE,

designated SEQ ID:22706, to the nucleotide sequence of VGAM401 RNA, herein designated VGAM RNA, also designated SEQ ID:3112.

[19491] Another function of VGAM401 is therefore inhibition of NAG14 (Accession NM\_022143). Accordingly, utilities of VGAM401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NAG14. Suppression of Tumorigenicity 7 Like (ST7L, Accession NM\_138727) is another VGAM401 host target gene. ST7L BINDING SITE1 through ST7L BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ST7L, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ST7L BINDING SITE1 through ST7L BINDING SITE3, designated SEQ ID:28979, SEQ ID:29210 and SEQ ID:19337 respectively, to the nucleotide sequence of VGAM401 RNA, herein designated VGAM RNA, also designated SEQ ID:3112.

[19492] Another function of VGAM401 is therefore inhibition of Suppression of Tumorigenicity 7 Like (ST7L, Accession NM\_138727). Accordingly, utilities of VGAM401 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with ST7L. LOC90593 (Accession XM\_032815) is another VGAM401 host target gene.

LOC90593 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90593, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90593 BINDING SITE, designated SEQ ID:31766, to the nucleotide sequence of VGAM401 RNA, herein designated VGAM RNA, also designated SEQ ID:3112.

[19493] Another function of VGAM401 is therefore inhibition of LOC90593 (Accession XM\_032815). Accordingly, utilities of VGAM401 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90593. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 402 (VGAM402) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19494] VGAM402 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM402 was detected is described hereinabove with reference to Figs. 1–8.

[19495] VGAM402 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria Hypovirus 1. VGAM402 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19496] VGAM402 gene encodes a VGAM402 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM402 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM402 precursor RNA is designated SEQ ID:388, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:388 is located at position 6807 relative to the genome of Cryphonectria Hypovirus 1.

[19497] VGAM402 precursor RNA folds onto itself, forming VGAM402 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19498] An enzyme complex designated DICER COMPLEX, `dices` the VGAM402 folded precursor RNA into VGAM402 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM402 RNA is designated SEQ ID:3113, and is provided hereinbelow with reference to the sequence listing part.

[19499] VGAM402 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM402 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM402 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19500] VGAM402 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM402 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM402 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM402 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM402 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19501] The complementary binding of VGAM402 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM402 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM402 host target RNA into VGAM402 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19502] It is appreciated that VGAM402 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM402 host target genes. The mRNA of each one of this plurality of VGAM402 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM402 RNA, herein designated VGAM RNA, and which when bound by VGAM402 RNA causes inhibition of translation of respective one or more VGAM402 host target proteins.

[19503] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM402 gene, herein designated VGAM GENE, on one or more VGAM402 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[19504] It is yet further appreciated that a function of VGAM402 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM402 include diagnosis, prevention and treatment of viral infection by Cryphonectria Hypovirus 1. Specific functions, and accordingly utilities, of VGAM402 correlate with, and may be deduced from, the identity of the host target genes which VGAM402 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19505] Nucleotide sequences of the VGAM402 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM402 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM402 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM402 are further described hereinbelow with reference to Table 1.

[19506] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM402 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM402 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19507] As mentioned hereinabove with reference to Fig. 1, a function of VGAM402 gene, herein designated VGAM is inhibition of expression of VGAM402 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM402 correlate with, and may be deduced from, the identity of the target genes which VGAM402 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19508] HUS1 Checkpoint Homolog (*S. pombe*) (HUS1, Accession XM\_165873) is a VGAM402 host target gene. HUS1 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by HUS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HUS1 BINDING SITE, designated SEQ ID:43790, to the nucleotide sequence of VGAM402 RNA, herein designated VGAM RNA, also designated SEQ ID:3113.

[19509] A function of VGAM402 is therefore inhibition of HUS1 Checkpoint Homolog (*S. pombe*) (HUS1, Accession XM\_165873), a gene which May form DNA damage-responsive protein complex . Accordingly, utilities of VGAM402 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HUS1. The function of HUS1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM228.N-myc Downstream Regulated Gene 1 (NDRG1, Accession XM\_005243) is another VGAM402 host target gene. NDRG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NDRG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of NDRG1 BINDING SITE, designated SEQ ID:29970, to the nucleotide sequence of VGAM402 RNA, herein designated VGAM RNA, also designated SEQ ID:3113.

[19510] Another function of VGAM402 is therefore inhibition of N-myc Downstream Regulated Gene 1 (NDRG1, Accession XM\_005243), a gene which may have a growth inhibitory role. Accordingly, utilities of VGAM402 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDRG1. The function of NDRG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM144.HSPC138 (Accession NM\_016401) is another VGAM402 host target gene. HSPC138 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HSPC138, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC138 BINDING SITE, designated SEQ ID:18538, to the nucleotide sequence of VGAM402 RNA, herein designated VGAM RNA, also designated SEQ ID:3113.

[19511] Another function of VGAM402 is therefore inhibition of HSPC138 (Accession NM\_016401). Accordingly, utilities of VGAM402 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC138. HSPC251 (Accession NM\_016505) is another VGAM402 host target gene. HSPC251 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HSPC251, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC251 BINDING SITE, designated SEQ ID:18584, to the nucleotide sequence of VGAM402 RNA, herein designated VGAM RNA, also designated SEQ ID:3113.

[19512] Another function of VGAM402 is therefore inhibition of HSPC251 (Accession NM\_016505). Accordingly, utilities of VGAM402 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC251. IDN3 (Accession NM\_133433) is another VGAM402 host target gene. IDN3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IDN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of IDN3 BINDING SITE, designated SEQ ID:28512, to the nucleotide sequence of VGAM402 RNA, herein designated VGAM RNA, also designated SEQ ID:3113.

[19513] Another function of VGAM402 is therefore inhibition of IDN3 (Accession NM\_133433). Accordingly, utilities of VGAM402 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IDN3. KIAA0284 (Accession XM\_032235) is another VGAM402 host target gene. KIAA0284 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0284, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0284 BINDING SITE, designated SEQ ID:31620, to the nucleotide sequence of VGAM402 RNA, herein designated VGAM RNA, also designated SEQ ID:3113.

[19514] Another function of VGAM402 is therefore inhibition of KIAA0284 (Accession XM\_032235). Accordingly, utilities of VGAM402 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0284. KIAA0844 (Accession NM\_014951) is another VGAM402 host target gene. KIAA0844 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0844, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0844 BINDING SITE, designated SEQ ID:17285, to the nucleotide sequence of VGAM402 RNA, herein designated VGAM RNA, also designated SEQ ID:3113.

[19515] Another function of VGAM402 is therefore inhibition of KIAA0844 (Accession NM\_014951). Accordingly, utilities of VGAM402 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0844. KIAA1068 (Accession NM\_015332) is another VGAM402 host target gene. KIAA1068 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1068, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1068 BINDING SITE, designated SEQ ID:17645, to the nucleotide sequence of VGAM402 RNA, herein designated

VGAM RNA, also designated SEQ ID:3113.

[19516] Another function of VGAM402 is therefore inhibition of KIAA1068 (Accession NM\_015332). Accordingly, utilities of VGAM402 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1068. KIAA1169 (Accession NM\_017901) is another VGAM402 host target gene. KIAA1169 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1169, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1169 BINDING SITE, designated SEQ ID:19566, to the nucleotide sequence of VGAM402 RNA, herein designated VGAM RNA, also designated SEQ ID:3113.

[19517] Another function of VGAM402 is therefore inhibition of KIAA1169 (Accession NM\_017901). Accordingly, utilities of VGAM402 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1169. KIAA1305 (Accession NM\_025081) is another VGAM402 host target gene. KIAA1305 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1305, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1305 BINDING SITE, designated SEQ ID:24682, to the nucleotide sequence of VGAM402 RNA, herein designated VGAM RNA, also designated SEQ ID:3113.

[19518] Another function of VGAM402 is therefore inhibition of KIAA1305 (Accession NM\_025081). Accordingly, utilities of VGAM402 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1305. KIAA1881 (Accession XM\_170901) is another VGAM402 host target gene. KIAA1881 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1881, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1881 BINDING SITE, designated SEQ ID:45656, to the nucleotide sequence of VGAM402 RNA, herein designated VGAM RNA, also designated SEQ ID:3113.

[19519] Another function of VGAM402 is therefore inhibition of KIAA1881 (Accession XM\_170901). Accordingly, utilities of VGAM402 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1881. KIAA1932 (Accession XM\_055900) is another VGAM402 host target gene. KIAA1932 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1932, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1932 BINDING SITE, designated SEQ ID:36351, to the nucleotide sequence of VGAM402 RNA, herein designated VGAM RNA, also designated SEQ ID:3113.

[19520] Another function of VGAM402 is therefore inhibition of KIAA1932 (Accession XM\_055900). Accordingly, utilities of VGAM402 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1932. PB1 (Accession NM\_018165) is another VGAM402 host target gene. PB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PB1 BINDING SITE, designated SEQ ID:19983, to the nucleotide sequence of

VGAM402 RNA, herein designated VGAM RNA, also designated SEQ ID:3113.

[19521] Another function of VGAM402 is therefore inhibition of PB1 (Accession NM\_018165). Accordingly, utilities of VGAM402 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PB1. Zinc Finger, DHHC Domain Containing 8 (ZDHHC8, Accession XM\_033828) is another VGAM402 host target gene. ZDHHC8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZDHHC8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZDHHC8 BINDING SITE, designated SEQ ID:31963, to the nucleotide sequence of VGAM402 RNA, herein designated VGAM RNA, also designated SEQ ID:3113.

[19522] Another function of VGAM402 is therefore inhibition of Zinc Finger, DHHC Domain Containing 8 (ZDHHC8, Accession XM\_033828). Accordingly, utilities of VGAM402 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZDHHC8. LOC145547 (Accession XM\_085167) is another VGAM402 host target

gene. LOC145547 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145547, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145547 BINDING SITE, designated SEQ ID:37892, to the nucleotide sequence of VGAM402 RNA, herein designated VGAM RNA, also designated SEQ ID:3113.

[19523] Another function of VGAM402 is therefore inhibition of LOC145547 (Accession XM\_085167). Accordingly, utilities of VGAM402 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145547. LOC152765 (Accession XM\_087519) is another VGAM402 host target gene. LOC152765 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152765, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152765 BINDING SITE, designated SEQ ID:39314, to the nucleotide sequence of VGAM402 RNA, herein designated VGAM RNA, also designated SEQ ID:3113.

[19524] Another function of VGAM402 is therefore inhibition of LOC152765 (Accession XM\_087519). Accordingly, utilities of VGAM402 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152765. LOC161635 (Accession XM\_172921) is another VGAM402 host target gene. LOC161635 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC161635, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC161635 BINDING SITE, designated SEQ ID:46185, to the nucleotide sequence of VGAM402 RNA, herein designated VGAM RNA, also designated SEQ ID:3113.

[19525] Another function of VGAM402 is therefore inhibition of LOC161635 (Accession XM\_172921). Accordingly, utilities of VGAM402 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161635. LOC253842 (Accession XM\_173230) is another VGAM402 host target gene. LOC253842 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253842, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253842 BINDING SITE, designated SEQ ID:46504, to the nucleotide sequence of VGAM402 RNA, herein designated VGAM RNA, also designated SEQ ID:3113.

[19526] Another function of VGAM402 is therefore inhibition of LOC253842 (Accession XM\_173230). Accordingly, utilities of VGAM402 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253842. LOC91149 (Accession XM\_036480) is another VGAM402 host target gene. LOC91149 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91149, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91149 BINDING SITE, designated SEQ ID:32452, to the nucleotide sequence of VGAM402 RNA, herein designated VGAM RNA, also designated SEQ ID:3113.

[19527] Another function of VGAM402 is therefore inhibition of LOC91149 (Accession XM\_036480). Accordingly, utilities of VGAM402 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC91149. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 403 (VGAM403) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19528] VGAM403 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM403 was detected is described hereinabove with reference to Figs. 1–8.

[19529] VGAM403 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria Hypovirus 1. VGAM403 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19530] VGAM403 gene encodes a VGAM403 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM403 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM403 precursor RNA is designated SEQ ID:389, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:389 is located at position 9304 relative to the genome of Cryphonectria Hypovirus 1.

[19531] VGAM403 precursor RNA folds onto itself, forming VGAM403 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19532] An enzyme complex designated DICER COMPLEX, `dices` the VGAM403 folded precursor RNA into VGAM403 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM403 RNA is designated SEQ ID:3114, and is provided hereinbelow with reference to the sequence listing part.

[19533] VGAM403 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM403 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM403 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19534] VGAM403 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM403 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM403 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM403 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM403 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[19535] The complementary binding of VGAM403 RNA, herein designated VGAM RNA, to host target binding sites on VGAM403 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM403 host target RNA into VGAM403 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19536] It is appreciated that VGAM403 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM403 host target genes. The mRNA of each one of this plurality of VGAM403 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM403 RNA, herein designated VGAM RNA, and which when bound by VGAM403 RNA causes in-

hibition of translation of respective one or more VGAM403 host target proteins.

[19537] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM403 gene, herein designated VGAM GENE, on one or more VGAM403 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[19538] It is yet further appreciated that a function of VGAM403 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM403 include diagnosis, prevention and

treatment of viral infection by Cryphonectria Hypovirus 1. Specific functions, and accordingly utilities, of VGAM403 correlate with, and may be deduced from, the identity of the host target genes which VGAM403 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19539] Nucleotide sequences of the VGAM403 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM403 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM403 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM403 are further described hereinbelow with reference to Table 1.

[19540] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM403 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM403 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19541] As mentioned hereinabove with reference to Fig. 1, a function of VGAM403 gene, herein designated VGAM is inhibition of expression of VGAM403 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM403 correlate with, and may be deduced from, the identity of the target genes which VGAM403 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19542] Cyclin-dependent Kinase 5, Regulatory Subunit 2 (p39) (CDK5R2, Accession NM\_003936) is a VGAM403 host target gene. CDK5R2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDK5R2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDK5R2 BINDING SITE, designated SEQ ID:10044, to the nucleotide sequence of VGAM403 RNA, herein designated VGAM RNA, also designated SEQ ID:3114.

[19543] A function of VGAM403 is therefore inhibition of Cyclin-dependent Kinase 5, Regulatory Subunit 2 (p39) (CDK5R2, Accession NM\_003936), a gene which acts as a regulatory subunit for the cyclin-dependent CDK5. Accordingly, utilities of VGAM403 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDK5R2. The function of CDK5R2 has been established by

previous studies. Neuronal CDC2 (OMIM Ref. No. 116940)–like kinase is a heterodimer of CDK5 (OMIM Ref. No. 123831) and p25(nck5a), a neuron–specific 25–kD regulatory subunit derived proteolytically from NCK5A (neuronal CDK5 activator; 603460). By screening a human hippocampus library with a bovine Nck5a cDNA, Tang et al. (1995) isolated cDNAs encoding NCK5AI, a distinct NCK5A isoform. They also referred to the protein as p39(OMIM Ref. No. nck5ai) based on its calculated molecular mass of 39 kD. The predicted 367–amino acid p39(OMIM Ref. No. nck5ai) protein shares 57% sequence identity with human NCK5A. As does p25(nck5a), a 30–kD truncated form of p39(OMIM Ref. No. nck5ai) activated both recombinant and native CDK5 in vitro. Northern blot analysis of rat tissues indicated that both Nck5A and p39(OMIM Ref. No. nck5ai) are expressed exclusively in brain. In situ hybridization to rat brain sections revealed that p39(OMIM Ref. No. nck5ai) mRNA was highly expressed in the CA1 to CA3 zone of hippocampal formation, an area highly enriched in neurons. There was no expression in the fimbria hippocampi, where glial cells predominate. Tang et al. (1995) concluded that p39(OMIM Ref. No. nck5ai) shares many common characteristics with

NCK5A, including CDK5-activating activity and brain- and neuron-specific expression. Nilden et al. (1998) identified Cdk5r2, the mouse gene homologous to human p39(OMIM Ref. No. nck5ai). The coding region of Cdk5r2 is contained within a single exon. The predicted mouse and human proteins are 95% identical.

[19544] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19545] Muravenko, O. V.; Gizatullin, R. Z.; Protopopov, A. I.; Kashuba, V. I.; Zabarovsky, E. R.; Zelenin, A. V. : Assignment of CDK5R2 coding for the cyclin-dependent kinase 5, regulatory subunit 2 (NCK5AI protein) to human chromosome band 2q35 by fluorescent in situ hybridization. Cytogenet. Cell Genet. 89: 160-161, 2000. ; and

[19546] Tang, D.; Yeung, J.; Lee, K-Y.; Matsushita, M.; Matsui, H.; Tomizawa, K.; Hatase, O.; Wang, J. H. : An isoform of the neuronal cyclin-dependent kinase 5 (Cdk5) activator. J. Biol. Chem.

[19547] Further studies establishing the function and utilities of CDK5R2 are found in John Hopkins OMIM database record ID 603764, and in cited publications numbered 7950-7952 listed in the bibliography section hereinbelow,

which are also hereby incorporated by reference. Winged-helix Nude (WHN, Accession NM\_003593) is another VGAM403 host target gene. WHN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WHN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WHN BINDING SITE, designated SEQ ID:9651, to the nucleotide sequence of VGAM403 RNA, herein designated VGAM RNA, also designated SEQ ID:3114.

[19548] Another function of VGAM403 is therefore inhibition of Winged-helix Nude (WHN, Accession NM\_003593), a gene which plays a role in transcriptional regulation. Accordingly, utilities of VGAM403 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WHN. The function of WHN has been established by previous studies. In 2 sisters with T-cell immunodeficiency, congenital alopecia, and nail dystrophy (OMIM Ref. No. 601705), Frank et al. (1999) identified a homozygous nonsense mutation in the WHN gene. In mammals, whn expression occurs in epithelial cells of the thymus as well as specific cells of the hair follicle. In the human, WHN is

expressed in the differentiating cells of the hair follicle precortex and the innermost cell layer of the outer root sheath. Expression in the thymus was not determined. Animal model experiments lend further support to the function of WHN. Mutations at the 'nude' locus of mice and rats disrupt normal hair growth and thymus development, causing nude mice and rats to be immune-deficient.

Nehls et al. (1994) showed that a gene designated whn, located in the region of mouse chromosome 11 known to contain the nude locus, encodes a new member of the winged-helix domain family of transcription factors. The predicted protein is 648 amino acids long. The whn gene was disrupted on the mouse and rat nude alleles. Mutant transcripts did not encode the characteristic DNA-binding domain, strongly suggesting that the whn gene is the nude gene. Mutations in winged-helix domain genes cause homeotic transformations in *Drosophila* and distort cell-fate decisions during vulval development in *C. elegans*. The whn gene was thus the first member of this class of genes to be implicated in a specific developmental defect in vertebrates

[19549] It is appreciated that the abovementioned animal model for WHN is acknowledged by those skilled in the art as a

scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[19550] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19551] Frank, J.; Pignata, C.; Panteleyev, A. A.; Prowse, D. M.; Baden, H.; Weiner, L.; Gaetaniello, L.; Ahmad, W.; Pozzi, N.; Caerhalmi-Friedman, P. B.; Aita, V. M.; Uyttendaele, H.; Gordon, D.; Ott, J.; Brisette, J. L.; Christiano, A. M. : Exposing the human nude phenotype. Nature 398: 473-474, 1999. ; and

[19552] Nehls, M.; Pfeifer, D.; Schorpp, M.; Hedrich, H.; Boehm, T. : New member of the winged-helix protein family disrupted in mouse and rat nude mutations. Nature 372: 103-107, 1994.

[19553] Further studies establishing the function and utilities of WHN are found in John Hopkins OMIM database record ID 600838, and in cited publications numbered 9595-9600 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Apolipoprotein L, 4 (APOL4, Accession NM\_030643) is another VGAM403 host target gene. APOL4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by APOL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APOL4 BINDING SITE, designated SEQ ID:24980, to the nucleotide sequence of VGAM403 RNA, herein designated VGAM RNA, also designated SEQ ID:3114.

[19554] Another function of VGAM403 is therefore inhibition of Apolipoprotein L, 4 (APOL4, Accession NM\_030643). Accordingly, utilities of VGAM403 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOL4. DCOHM (Accession NM\_032151) is another VGAM403 host target gene. DCOHM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DCOHM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCOHM BINDING SITE, designated SEQ ID:25849, to the nucleotide sequence of VGAM403 RNA, herein designated VGAM RNA, also designated SEQ ID:3114.

[19555] Another function of VGAM403 is therefore inhibition of DCOHM (Accession NM\_032151). Accordingly, utilities of

VGAM403 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCOHM. FLJ22028 (Accession NM\_024854) is another VGAM403 host target gene. FLJ22028 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22028, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22028 BINDING SITE, designated SEQ ID:24287, to the nucleotide sequence of VGAM403 RNA, herein designated VGAM RNA, also designated SEQ ID:3114.

[19556] Another function of VGAM403 is therefore inhibition of FLJ22028 (Accession NM\_024854). Accordingly, utilities of VGAM403 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22028. KIAA0441 (Accession NM\_014797) is another VGAM403 host target gene. KIAA0441 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0441, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0441 BINDING SITE,

designated SEQ ID:16716, to the nucleotide sequence of VGAM403 RNA, herein designated VGAM RNA, also designated SEQ ID:3114.

[19557] Another function of VGAM403 is therefore inhibition of KIAA0441 (Accession NM\_014797). Accordingly, utilities of VGAM403 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0441. Ring Finger Protein 34 (RNF34, Accession NM\_025126) is another VGAM403 host target gene. RNF34 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNF34, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF34 BINDING SITE, designated SEQ ID:24770, to the nucleotide sequence of VGAM403 RNA, herein designated VGAM RNA, also designated SEQ ID:3114.

[19558] Another function of VGAM403 is therefore inhibition of Ring Finger Protein 34 (RNF34, Accession NM\_025126). Accordingly, utilities of VGAM403 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF34. Syntaxin 12 (STX12, Accession

XM\_039018) is another VGAM403 host target gene. STX12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STX12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STX12 BINDING SITE, designated SEQ ID:32984, to the nucleotide sequence of VGAM403 RNA, herein designated VGAM RNA, also designated SEQ ID:3114.

[19559] Another function of VGAM403 is therefore inhibition of Syntaxin 12 (STX12, Accession XM\_039018). Accordingly, utilities of VGAM403 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STX12. LOC146733 (Accession XM\_097076) is another VGAM403 host target gene. LOC146733 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146733, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146733 BINDING SITE, designated SEQ ID:40725, to the nucleotide sequence of VGAM403 RNA, herein designated VGAM RNA, also designated SEQ ID:3114.

[19560] Another function of VGAM403 is therefore inhibition of LOC146733 (Accession XM\_097076). Accordingly, utilities of VGAM403 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146733. LOC219686 (Accession XM\_165544) is another VGAM403 host target gene. LOC219686 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219686, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219686 BINDING SITE, designated SEQ ID:43678, to the nucleotide sequence of VGAM403 RNA, herein designated VGAM RNA, also designated SEQ ID:3114.

[19561] Another function of VGAM403 is therefore inhibition of LOC219686 (Accession XM\_165544). Accordingly, utilities of VGAM403 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219686. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 404 (VGAM404) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[19562] VGAM404 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM404 was detected is described hereinabove with reference to Figs. 1–8.

[19563] VGAM404 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria Hypovirus 1. VGAM404 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19564] VGAM404 gene encodes a VGAM404 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM404 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM404 precursor RNA is designated SEQ ID:390, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:390 is located at position 7366 relative to the genome of Cryphonectria Hypovirus 1.

[19565] VGAM404 precursor RNA folds onto itself, forming VGAM404 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional  
`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[19566] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM404 folded precursor RNA into VGAM404 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 43%) nucleotide se-  
quence of VGAM404 RNA is designated SEQ ID:3115, and  
is provided hereinbelow with reference to the sequence  
listing part.

[19567] VGAM404 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM404 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM404 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19568] VGAM404 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM404 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM404 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM404 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM404 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19569] The complementary binding of VGAM404 RNA, herein designated VGAM RNA, to host target binding sites on VGAM404 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM404 host target RNA into VGAM404 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19570] It is appreciated that VGAM404 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM404 host target genes. The mRNA of each one of this plurality of VGAM404 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM404 RNA, herein designated VGAM RNA, and which when bound by VGAM404 RNA causes inhibition of translation of respective one or more VGAM404 host target proteins.

[19571] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM404 gene, herein designated VGAM GENE, on one or more VGAM404 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[19572] It is yet further appreciated that a function of VGAM404 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM404 include diagnosis, prevention and treatment of viral infection by Cryphonectria Hypovirus 1. Specific functions, and accordingly utilities, of VGAM404 correlate with, and may be deduced from, the identity of the host target genes which VGAM404 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

- [19573] Nucleotide sequences of the VGAM404 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM404 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM404 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM404 are further described hereinbelow with reference to Table 1.
- [19574] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM404 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM404 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [19575] As mentioned hereinabove with reference to Fig. 1, a function of VGAM404 gene, herein designated VGAM is inhibition of expression of VGAM404 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM404 correlate with, and may be deduced from, the identity of the target genes which VGAM404 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19576] F-box and Leucine-rich Repeat Protein 11 (FBXL11, Accession NM\_012308) is a VGAM404 host target gene. FBXL11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBXL11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXL11 BINDING SITE, designated SEQ ID:14680, to the nucleotide sequence of VGAM404 RNA, herein designated VGAM RNA, also designated SEQ ID:3115.

[19577] A function of VGAM404 is therefore inhibition of F-box and Leucine-rich Repeat Protein 11 (FBXL11, Accession NM\_012308), a gene which are BTB/POZ domain-containing zinc finger proteins implicated in oncogenesis. Accordingly, utilities of VGAM404 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXL11. The function of FBXL11 has been established by previous studies. The F box, named after cyclin F (CCNF; 600227), in which it was originally observed, is an approximately 40-amino acid motif that binds SKP1 (OMIM Ref. No. 601434). F-box proteins are components of modular E3 ubiquitin protein ligases called

SCFs (SKP1, OMIM Ref. No. 603134), F-box proteins), which function in phosphorylation-dependent ubiquitination. Using a yeast 2-hybrid screen with SKP1 as bait, followed by searching sequence databases, Winston et al. (1999) and Cenciarelli et al. (1999) identified 33 mammalian and 26 human F-box proteins, respectively. These contained C termini with leucine-rich repeats (FBXLs, e.g., SKP2 (OMIM Ref. No. 601436)), WD40 domains (FBXWs, e.g., BTRCP (OMIM Ref. No. 603482)), or no recognizable motifs (FBXOs, e.g., CCNF). By searching sequence databases, Ilyin et al. (2000) identified a cDNA encoding FBXL11, which they referred to as FBL7. They predicted that FBXL11, which is identical to the 496-amino acid KIAA1004 protein reported by Nagase et al. (1999), contains at least 6 highly degenerated leucine-rich repeats. By RT-PCR analysis, Nagase et al. (1999) detected ubiquitous expression of FBXL11, with highest levels in brain, testis, and ovary, followed by lung; lowest expression was in pancreas. Within brain, expression was highest in cerebellum and subthalamic nuclei. The International Radiation Hybrid Mapping Consortium mapped the FBXL11 gene to chromosome 11 (sts-Z40471).

[19578] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[19579] Ilyin, G. P.; Rialland, M.; Pigeon, C.; Guguen-Guillouzo, C. : cDNA cloning and expression analysis of new members of the mammalian F-box protein family. *Genomics* 67: 40-47, 2000. ; and

[19580] Nagase, T.; Ishikawa, K.; Suyama, M.; Kikuno, R.; Hiro-sawa, M.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human ge.

[19581] Further studies establishing the function and utilities of FBXL11 are found in John Hopkins OMIM database record ID 605657, and in cited publications numbered 409, 827 and 8593 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 1 (GalNAc-T1) (GALNT1, Accession NM\_020474) is another VGAM404 host target gene. GALNT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GALNT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of GALNT1 BINDING SITE, designated SEQ ID:21723, to the nucleotide sequence of VGAM404 RNA, herein designated VGAM RNA, also designated SEQ ID:3115.

[19582] Another function of VGAM404 is therefore inhibition of UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 1 (GalNAc-T1) (GALNT1, Accession NM\_020474), a gene which transfers an N-acetyl galactosamine (GalNAc) to a serine or threonine residue in the first step of O-linked oligosaccharide biosynthesis. Accordingly, utilities of VGAM404 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALNT1. The function of GALNT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM120.Rab Geranylgeranyltransferase, Alpha Subunit (RABGGTA, Accession NM\_004581) is another VGAM404 host target gene. RABGGTA BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RABGGTA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of RABGGTA BINDING SITE, designated SEQ ID:10930, to the nucleotide sequence of VGAM404 RNA, herein designated VGAM RNA, also designated SEQ ID:3115.

[19583] Another function of VGAM404 is therefore inhibition of Rab Geranylgeranyltransferase, Alpha Subunit (RABGGTA, Accession NM\_004581), a gene which is the alpha subunit of geranylgeranyl transferase. Accordingly, utilities of VGAM404 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RABGGTA. The function of RABGGTA has been established by previous studies. Van Bokhoven et al. (1996) cloned the human RABGGTA gene from a fetal brain library. The gene encodes a 567-amino acid polypeptide. Homology to the transglutaminase gene, TGM1 (OMIM Ref. No. 190195), which maps to 14q11, indicated that this subunit was located on the same chromosomal band; Southern blot analysis confirmed this locus. Van Bokhoven et al. (1996) found that the 3-prime end of the RABGGTA cDNA sequence overlaps the promoter region of TGM1. Further analysis revealed that the RABGGTA and TGM1 genes are located only 2 kb apart in head-to-tail tandem arrangement; however, these 2 genes are not likely to be func-

tionally related. Animal model experiments lend further support to the function of RABGGTA. Mice homozygous for 'gunmetal' (gm), a spontaneous, recessive mutation, have prolonged bleeding caused by defects in platelets and megakaryocytes (Swank et al., 1993; Novak et al., 1995). These mice also have macrothrombocytopenia and reduced platelet alpha- and delta-granule contents (storage pool deficiency, SPD). Megakaryocytes, the progenitors of platelets, are more plentiful in gm mice, but have abnormal intracellular membranes, increased emperipolesis (the active movement of 1 cell through another), and decreased platelet synthesis. In addition, gm homozygotes have partial cutaneous albinism, the feature that gives the mutation its name. Detter et al. (2000) noted that the phenotype resembles human gray platelet syndrome (GPS; 139090) and platelet alpha- and delta-SPD (OMIM Ref. No. 185050).

[19584] It is appreciated that the abovementioned animal model for RABGGTA is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[19585] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [19586] Detter, J. C.; Zhang, Q.; Mules, E. H.; Novak, E. K.; Mishra, V. S.; Li, W.; McMurtrie, E. B.; Tchernev, V. T.; Wallace, M. R.; Seabra, M. C.; Swank, R. T.; Kingsmore, S. F. : Rab geranylgeranyl transferase alpha mutation in the gunmetal mouse reduces Rab prenylation and platelet synthesis. Proc. Nat. Acad. Sci. 97: 4144–4149, 2000. ; and
- [19587] van Bokhoven, H.; Rawson, R. B.; Merkx, G. F. M.; Cremers, F. P. M.; Seabra, M. C. : cDNA cloning and chromosomal localization of the genes encoding the alpha- and beta-subunits of huma.
- [19588] Further studies establishing the function and utilities of RABGGTA are found in John Hopkins OMIM database record ID 601905, and in cited publications numbered 8883–8884, 1187–118 and 8885 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Regulator of G-protein Signalling 3 (RGS3, Accession NM\_021106) is another VGAM404 host target gene. RGS3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RGS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of RGS3 BINDING SITE, designated SEQ ID:22087, to the nucleotide sequence of VGAM404 RNA, herein designated VGAM RNA, also designated SEQ ID:3115.

[19589] Another function of VGAM404 is therefore inhibition of Regulator of G-protein Signalling 3 (RGS3, Accession NM\_021106), a gene which negatively regulates G protein-coupled receptor signalling. Accordingly, utilities of VGAM404 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGS3. The function of RGS3 has been established by previous studies. Chatterjee et al. (1997) stated that 17 mammalian RGS members had been identified by cloning or by comparison to expressed sequence tags (ESTs). They studied RGS3, the largest member of the RGS family to date. They found that the coding region of the human RGS3 gene spans 14.7 kb and contains 6 exons; the 5-prime untranslated region spans 3.2 kb and contains 2 exons. The RGS domain, conserved among all RGS proteins, is encoded by 3 exons, while the unique N-terminal domain of RGS3 is encoded by a single exon. Comparison of the locations of the intron-exon boundaries of the human RGS3 gene to those of the human RGS2 gene revealed a remarkable

similarity. Using 5-prime-RACE analysis, they mapped the transcription start site 517 bp upstream of the translation start site. Many potential regulatory elements were identified in the 5-prime flanking region. By screening a mouse embryonic cDNA library using the yeast 2-hybrid system with the cytoplasmic domain of ephrin-B2 (EFNB2; 600527) as bait, Lu et al. (2001) isolated cDNAs encoding a cytoplasmic protein they designated Pdз-Rgs3. Pdз-Rgs3 binds ephrin-B2 through a PDZ domain, and it has an RGS domain. The human homolog of Pdз-Rgs3, RGS3, had been described as a shorter sequence (Druey et al., 1996). Pdз-Rgs3 can mediate signaling from the ephrin-B cytoplasmic tail. The authors showed that SDF1 (OMIM Ref. No. 600835), a chemokine with a G protein-coupled receptor, and BDNF (OMIM Ref. No. 113505) are chemoattractants for cerebellar granule cells, and that SDF1 chemoattraction is selectively inhibited by soluble ephrin-B receptor (see OMIM Ref. No. 602757). This inhibition could be blocked by a truncated Pdз-Rgs3 protein lacking the RGS domain.

[19590] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [19591] Druey, K. M.; Blumer, K. J.; Kang, V. H.; Kehrl, J. H. : Inhibition of G-protein-mediated MAP kinase activation by a new mammalian gene family. *Nature* 379: 742–746, 1996.  
; and
- [19592] Chatterjee, T. K.; Eapen, A.; Kanis, A. B.; Fisher, R. A. : Genomic organization, 5-prime-flanking region, and chromosomal localization of the human RGS3 gene. *Genomics* 45: 429–433, 1997.
- [19593] Further studies establishing the function and utilities of RGS3 are found in John Hopkins OMIM database record ID 602189, and in cited publications numbered 5845–584 and 12564 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZP434H132 (Accession XM\_057020) is another VGAM404 host target gene. DKFZP434H132 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZP434H132, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434H132 BINDING SITE, designated SEQ ID:36446, to the nucleotide sequence of VGAM404 RNA, herein designated VGAM RNA, also designated SEQ ID:3115.

[19594] Another function of VGAM404 is therefore inhibition of DKFZP434H132 (Accession XM\_057020). Accordingly, utilities of VGAM404 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434H132. KIAA1600 (Accession XM\_049351) is another VGAM404 host target gene. KIAA1600 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1600, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1600 BINDING SITE, designated SEQ ID:35392, to the nucleotide sequence of VGAM404 RNA, herein designated VGAM RNA, also designated SEQ ID:3115.

[19595] Another function of VGAM404 is therefore inhibition of KIAA1600 (Accession XM\_049351). Accordingly, utilities of VGAM404 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1600. MGC2628 (Accession NM\_024076) is another VGAM404 host target gene. MGC2628 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC2628, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2628 BINDING SITE, designated SEQ ID:23508, to the nucleotide sequence of VGAM404 RNA, herein designated VGAM RNA, also designated SEQ ID:3115.

[19596] Another function of VGAM404 is therefore inhibition of MGC2628 (Accession NM\_024076). Accordingly, utilities of VGAM404 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2628. Oxysterol Binding Protein-like 3 (OSBPL3, Accession NM\_015550) is another VGAM404 host target gene. OSBPL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OSBPL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL3 BINDING SITE, designated SEQ ID:17815, to the nucleotide sequence of VGAM404 RNA, herein designated VGAM RNA, also designated SEQ ID:3115.

[19597] Another function of VGAM404 is therefore inhibition of Oxysterol Binding Protein-like 3 (OSBPL3, Accession NM\_015550). Accordingly, utilities of VGAM404 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL3. Synaptotagmin XII (SYT12, Accession XM\_170657) is another VGAM404 host target gene. SYT12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SYT12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYT12 BINDING SITE, designated SEQ ID:45431, to the nucleotide sequence of VGAM404 RNA, herein designated VGAM RNA, also designated SEQ ID:3115.

[19598] Another function of VGAM404 is therefore inhibition of Synaptotagmin XII (SYT12, Accession XM\_170657). Accordingly, utilities of VGAM404 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYT12. LOC124976 (Accession XM\_058879) is another VGAM404 host target gene. LOC124976 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC124976, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC124976 BINDING SITE, designated SEQ ID:36782, to the nucleotide sequence of VGAM404 RNA, herein designated VGAM RNA, also designated SEQ ID:3115.

[19599] Another function of VGAM404 is therefore inhibition of LOC124976 (Accession XM\_058879). Accordingly, utilities of VGAM404 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124976. LOC148114 (Accession XM\_086050) is another VGAM404 host target gene. LOC148114 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148114 BINDING SITE, designated SEQ ID:38465, to the nucleotide sequence of VGAM404 RNA, herein designated VGAM RNA, also designated SEQ ID:3115.

[19600] Another function of VGAM404 is therefore inhibition of LOC148114 (Accession XM\_086050). Accordingly, utilities of VGAM404 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148114. LOC254428 (Accession XM\_170932) is another VGAM404 host target gene. LOC254428 BINDING

SITE is HOST TARGET binding site found in the 3` un-translated region of mRNA encoded by LOC254428, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254428 BINDING SITE, designated SEQ ID:45715, to the nucleotide sequence of VGAM404 RNA, herein designated VGAM RNA, also designated SEQ ID:3115.

[19601] Another function of VGAM404 is therefore inhibition of LOC254428 (Accession XM\_170932). Accordingly, utilities of VGAM404 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254428. LOC254945 (Accession XM\_173038) is another VGAM404 host target gene. LOC254945 BINDING SITE is HOST TARGET binding site found in the 5` un-translated region of mRNA encoded by LOC254945, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254945 BINDING SITE, designated SEQ ID:46304, to the nucleotide sequence of VGAM404 RNA, herein designated VGAM RNA, also designated SEQ ID:3115.

[19602] Another function of VGAM404 is therefore inhibition of

LOC254945 (Accession XM\_173038). Accordingly, utilities of VGAM404 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254945. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 405 (VGAM405) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19603] VGAM405 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM405 was detected is described hereinabove with reference to Figs. 1–8.

[19604] VGAM405 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria Hypovirus 1. VGAM405 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19605] VGAM405 gene encodes a VGAM405 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM405 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM405 precursor RNA is designated SEQ ID:391, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:391 is located at position 3539 relative to the genome of Cryphonectria Hypovirus 1.

[19606] VGAM405 precursor RNA folds onto itself, forming VGAM405 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19607] An enzyme complex designated DICER COMPLEX, `dices` the VGAM405 folded precursor RNA into VGAM405 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide se-

quence of VGAM405 RNA is designated SEQ ID:3116, and is provided hereinbelow with reference to the sequence listing part.

[19608] VGAM405 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM405 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM405 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[19609] VGAM405 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM405 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM405 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM405 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM405 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[19610] The complementary binding of VGAM405 RNA, herein designated VGAM RNA, to host target binding sites on VGAM405 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM405 host target RNA into VGAM405 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19611] It is appreciated that VGAM405 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM405 host target genes. The mRNA of each one of this plurality of VGAM405 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM405 RNA, herein designated VGAM RNA, and which when bound by VGAM405 RNA causes inhibition of translation of respective one or more VGAM405 host target proteins.

[19612] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM405 gene, herein designated VGAM GENE, on one or more VGAM405 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[19613] It is yet further appreciated that a function of VGAM405 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM405 include diagnosis, prevention and treatment of viral infection by Cryphonectria Hypovirus 1. Specific functions, and accordingly utilities, of VGAM405 correlate with, and may be deduced from, the identity of the host target genes which VGAM405 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19614] Nucleotide sequences of the VGAM405 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM405 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM405 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM405 are further described hereinbelow with reference to Table 1.

[19615] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM405 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM405 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19616] As mentioned hereinabove with reference to Fig. 1, a function of VGAM405 gene, herein designated VGAM is inhibition of expression of VGAM405 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM405 correlate with, and may be deduced from, the identity of the target genes which VGAM405 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19617] TOSO (Accession NM\_005449) is a VGAM405 host target gene. TOSO BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TOSO, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOSO BINDING SITE, designated SEQ ID:11935, to the nucleotide sequence of VGAM405 RNA, herein designated VGAM RNA, also designated SEQ ID:3116.

[19618] A function of VGAM405 is therefore inhibition of TOSO (Accession NM\_005449). Accordingly, utilities of VGAM405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOSO. LOC152283 (Accession XM\_098196) is another VGAM405 host target gene. LOC152283 BINDING SITE is HOST TAR-

GET binding site found in the 5' untranslated region of mRNA encoded by LOC152283, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152283 BINDING SITE, designated SEQ ID:41484, to the nucleotide sequence of VGAM405 RNA, herein designated VGAM RNA, also designated SEQ ID:3116.

[19619] Another function of VGAM405 is therefore inhibition of LOC152283 (Accession XM\_098196). Accordingly, utilities of VGAM405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152283. LOC255002 (Accession XM\_172994) is another VGAM405 host target gene. LOC255002 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255002, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255002 BINDING SITE, designated SEQ ID:46270, to the nucleotide sequence of VGAM405 RNA, herein designated VGAM RNA, also designated SEQ ID:3116.

[19620] Another function of VGAM405 is therefore inhibition of

LOC255002 (Accession XM\_172994). Accordingly, utilities of VGAM405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255002. LOC92017 (Accession XM\_042234) is another VGAM405 host target gene. LOC92017 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92017, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92017 BINDING SITE, designated SEQ ID:33707, to the nucleotide sequence of VGAM405 RNA, herein designated VGAM RNA, also designated SEQ ID:3116.

[19621] Another function of VGAM405 is therefore inhibition of LOC92017 (Accession XM\_042234). Accordingly, utilities of VGAM405 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92017. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 406 (VGAM406) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[19622] VGAM406 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM406 was detected is described hereinabove with reference to Figs. 1–8.

[19623] VGAM406 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Cryphonectria Hypovirus 1. VGAM406 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19624] VGAM406 gene encodes a VGAM406 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM406 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM406 precursor RNA is designated SEQ ID:392, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:392 is located at position 3878 relative to the genome of Cryphonectria Hypovirus 1.

[19625] VGAM406 precursor RNA folds onto itself, forming VGAM406 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[19626] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM406 folded precursor RNA into VGAM406 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 55%) nucleotide se-  
quence of VGAM406 RNA is designated SEQ ID:3117, and  
is provided hereinbelow with reference to the sequence  
listing part.

[19627] VGAM406 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM406 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM406 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding  
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[19628] VGAM406 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM406 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM406 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM406 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM406 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[19629] The complementary binding of VGAM406 RNA, herein designated VGAM RNA, to host target binding sites on VGAM406 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM406 host target RNA into VGAM406 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19630] It is appreciated that VGAM406 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM406 host target genes. The mRNA of each one of this plurality of VGAM406 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM406 RNA, herein designated VGAM RNA, and which when bound by VGAM406 RNA causes inhibition of translation of respective one or more VGAM406 host target proteins.

[19631] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM406 gene, herein designated VGAM GENE, on one or

more VGAM406 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[19632] It is yet further appreciated that a function of VGAM406 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM406 include diagnosis, prevention and treatment of viral infection by Cryphonectria Hypovirus 1. Specific functions, and accordingly utilities, of VGAM406 correlate with, and may be deduced from, the identity of the host target genes which VGAM406 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [19633] Nucleotide sequences of the VGAM406 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM406 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM406 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM406 are further described hereinbelow with reference to Table 1.
- [19634] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM406 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM406 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [19635] As mentioned hereinabove with reference to Fig. 1, a function of VGAM406 gene, herein designated VGAM is inhibition of expression of VGAM406 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM406 correlate with, and may be deduced from, the identity of the target genes which VGAM406 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [19636] Deleted In Lung and Esophageal Cancer 1 (DLEC1, Acces-

sion NM\_007338) is a VGAM406 host target gene. DLEC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DLEC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DLEC1 BINDING SITE, designated SEQ ID:14270, to the nucleotide sequence of VGAM406 RNA, herein designated VGAM RNA, also designated SEQ ID:3117.

[19637] A function of VGAM406 is therefore inhibition of Deleted In Lung and Esophageal Cancer 1 (DLEC1, Accession NM\_007338). Accordingly, utilities of VGAM406 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DLEC1. Estrogen-related Receptor Beta (ESRRB, Accession XM\_041087) is another VGAM406 host target gene. ESRRB BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ESRRB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESRRB BINDING SITE, designated SEQ ID:33438, to the nucleotide sequence of VGAM406 RNA, herein designated VGAM RNA, also design-

nated SEQ ID:3117.

[19638] Another function of VGAM406 is therefore inhibition of Estrogen-related Receptor Beta (ESRRB, Accession XM\_041087), a gene which Estrogen-related receptor beta; member of the nuclear hormone receptor family. Accordingly, utilities of VGAM406 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESRRB. The function of ESRRB has been established by previous studies. See estrogen-related receptor-alpha (ESRRA; 601998). Giguere et al. (1988) first identified ESRRB as a gene whose product is similar to the estrogen receptor (OMIM Ref. No. 133430). Sladek et al. (1997) mapped ESRRB to 14q24.3 by fluorescence in situ hybridization. Luo et al. (1997) demonstrated that mouse *Esrrb* plays an essential role in placental development: homozygous null *Esrrb* mutants die in midgestation due to abnormal development of the chorion and defective diploid trophoblast proliferation. Its embryonic lethal phenotype prevented the identification of potential roles for ESRRB in postnatal physiology.

[19639] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [19640] Luo, J.; Sladek, R.; Bader, J. A.; Matthyssen, A.; Rossant, J.; Giguere, V. : Placental abnormalities in mouse embryos lacking orphan nuclear receptor ERR-beta. Nature 388: 778-782, 1997. ; and
- [19641] Sladek, R.; Beatty, B.; Squire, J.; Copeland, N. G.; Gilbert, D. J.; Jenkins, N. A.; Giguere, V. : Chromosomal mapping of the human and murine orphan receptors ERR-alpha (ESRRA) and ERR.
- [19642] Further studies establishing the function and utilities of ESRRB are found in John Hopkins OMIM database record ID 602167, and in cited publications numbered 94 and 6348 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Kruppel-like Factor 4 (gut) (KLF4, Accession NM\_004235) is another VGAM406 host target gene. KLF4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KLF4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLF4 BINDING SITE, designated SEQ ID:10429, to the nucleotide sequence of VGAM406 RNA, herein designated VGAM RNA, also designated SEQ ID:3117.

[19643] Another function of VGAM406 is therefore inhibition of Kruppel-like Factor 4 (gut) (KLF4, Accession NM\_004235), a gene which may be involved in the differentiation of epithelial cells and may also function in the development of the skeleton and kidney. Accordingly, utilities of VGAM406 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLF4. The function of KLF4 has been established by previous studies. Shields et al. (1996) cloned a mouse cDNA, which they named gut-enriched Kruppel-like factor (Gklf), that encodes a member of the Kruppel family of transcription factors. Immunofluorescence revealed that Gklf is localized to the nucleus and is found at highest levels in growth-arrested cells. Shields et al. (1996) found that transfection of Gklf into COS-1 cells causes an inhibition of DNA synthesis. In the mouse, the authors found that Gklf mRNA is most abundant in the colon and is also expressed in the testis, lung, and small intestine. Garrett-Sinha et al. (1996) identified a novel zinc finger protein whose mRNA is expressed at high levels in the epidermal layer of the skin and in epithelial cells in the tongue, palate, esophagus, stomach, and colon of newborn mice. They named the protein EZF for 'epithelial zinc finger.' By

screening a human umbilical vein endothelial cell cDNA library with a cDNA encoding the C-terminal zinc finger region of EKLF (KLF1; 600599), Yet et al. (1998) isolated a cDNA encoding KLF4, which they called EZF. The predicted 470-amino acid KLF4 protein has a proline- and serine-rich N terminus and contains 3 C<sub>2</sub>H<sub>2</sub> Kruppel-type zinc fingers at the C terminus. KLF4 also contains a potential nuclear localization signal. The human KLF4 protein shares 91% sequence identity with mouse Ezf. Recombinant KLF4 bound specifically to a probe containing the CACCC core sequence in gel mobility shift assays. In contrast to other members of the EKLF family, which are transcriptional activators, KLF4 functioned as a transcriptional repressor in transient transfection studies. The authors identified both the repression domain and the activation domain within KLF4. Northern blot analysis detected a 3.5-kb KLF4 transcript in RNA from both human umbilical vein endothelial cells and human aortic endothelial cells. By radiation hybrid mapping, Yet et al. (1998) mapped the human KLF4 gene to 9q31. Garrett-Sinha et al. (1996) mapped the mouse EZF gene to chromosome 4, in close proximity to the thioredoxin gene (OMIM Ref. No. 187700). Animal model experiments lend further support

to the function of KLF4. Located at the interface between body and environment, the epidermis must protect the body against toxic agents and dehydration, and protect itself against physical and mechanical stresses. Acquired just before birth and at the last stage of epidermal differentiation, the skin's proteinaceous/lipid barrier creates a surface seal essential for protecting animals against microbial infections and dehydration. Segre et al. (1999) showed that Kruppel-like factor-4 (KLF4), highly expressed in the differentiating layers of epidermis, is both vital to and selective for barrier acquisition. *Klf4*  $-/-$  mice die shortly after birth due to loss of skin barrier function, as measured by penetration of external dyes and rapid loss of body fluids. The defect was not corrected by grafting of *Klf4*  $-/-$  skin onto nude mice. Loss of the barrier occurred without morphologic or biochemical alterations to the well-known structural features of epidermis that are essential for mechanical integrity. Instead, late-stage differentiation structures were selectively perturbed, including the cornified envelope, a likely scaffold for lipid organization. Using suppressive hybridization, Segre et al. (1999) identified 3 transcripts encoding cornified envelope proteins with altered expression in the absence of

Klf4. Sprr2a (OMIM Ref. No. 182267) was one, this being the only epidermal gene whose promoter is known to possess a functional Klf4 binding site. These studies provide a new insight into transcriptional governance of barrier function, and pave the way for unraveling the molecular events that orchestrate this essential process

[19644] It is appreciated that the abovementioned animal model for KLF4 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[19645] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19646] Garrett-Sinha, L. A.; Eberspaecher, H.; Seldin, M. F.; de Crombrughe, B. : A gene for a novel zinc-finger protein expressed in differentiated epithelial cells and transiently in certain mesenchymal cells. J. Biol. Chem. 271: 31384–31390, 1996. ; and

[19647] Segre, J. A.; Bauer, C.; Fuchs, E. : Klf4 is a transcription factor required for establishing the barrier function of the skin. Nature Genet. 22: 356–360, 1999.

[19648] Further studies establishing the function and utilities of KLF4 are found in John Hopkins OMIM database record ID

602253, and in cited publications numbered 926–929 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Neurotensin Receptor 1 (high affinity) (NTSR1, Accession NM\_002531) is another VGAM406 host target gene. NTSR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NTSR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NTSR1 BINDING SITE, designated SEQ ID:8367, to the nucleotide sequence of VGAM406 RNA, herein designated VGAM RNA, also designated SEQ ID:3117.

[19649] Another function of VGAM406 is therefore inhibition of Neurotensin Receptor 1 (high affinity) (NTSR1, Accession NM\_002531), a gene which is associated with G proteins that activate a phosphatidylinositol–calcium second messenger system. Accordingly, utilities of VGAM406 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NTSR1. The function of NTSR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM200.Phospholipase A2, Group IID (PLA2G2D, Accession NM\_012400) is another VGAM406 host target gene. PLA2G2D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLA2G2D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLA2G2D BINDING SITE, designated SEQ ID:14768, to the nucleotide sequence of VGAM406 RNA, herein designated VGAM RNA, also designated SEQ ID:3117.

[19650] Another function of VGAM406 is therefore inhibition of Phospholipase A2, Group IID (PLA2G2D, Accession NM\_012400), a gene which is involved in phospholipid digestion, remodeling of cell membranes, and host defense, as well as pathophysiologic processes. Accordingly, utilities of VGAM406 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLA2G2D. The function of PLA2G2D and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM74.Recombination Activating Gene 2 (RAG2, Accession XM\_089839) is another VGAM406

host target gene. RAG2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAG2 BINDING SITE, designated SEQ ID:39987, to the nucleotide sequence of VGAM406 RNA, herein designated VGAM RNA, also designated SEQ ID:3117.

[19651] Another function of VGAM406 is therefore inhibition of Recombination Activating Gene 2 (RAG2, Accession XM\_089839). Accordingly, utilities of VGAM406 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAG2. SORCS2 (Accession NM\_020777) is another VGAM406 host target gene. SORCS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SORCS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SORCS2 BINDING SITE, designated SEQ ID:21874, to the nucleotide sequence of VGAM406 RNA, herein designated VGAM RNA, also designated SEQ

ID:3117.

[19652] Another function of VGAM406 is therefore inhibition of SORCS2 (Accession NM\_020777). Accordingly, utilities of VGAM406 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SORCS2. TEM5 (Accession NM\_032777) is another VGAM406 host target gene. TEM5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TEM5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEM5 BINDING SITE, designated SEQ ID:26520, to the nucleotide sequence of VGAM406 RNA, herein designated VGAM RNA, also designated SEQ ID:3117.

[19653] Another function of VGAM406 is therefore inhibition of TEM5 (Accession NM\_032777), a gene which involves in development of midline glia and commissural axon pathways. Accordingly, utilities of VGAM406 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEM5. The function of TEM5 has been established by previous studies. Using serial analysis of gene expression (SAGE), St Croix et al. (2000) identified

partial cDNAs corresponding to several tumor endothelial markers (TEMs) that displayed elevated expression during tumor angiogenesis. Among the genes they identified was TEM5. Using database searches and 5-prime RACE, Carson-Walter et al. (2001) derived sequences covering the entire TEM5 coding region, which encodes a predicted 7-pass transmembrane protein of 1,331 amino acids. The N-terminal extracellular region contains 4 simple leucine-rich repeats (LRRs), a C-terminal LRR, an immunoglobulin-type domain, a hormone receptor domain, and a putative G protein-coupled receptor (GPCR) proteolysis site domain typical of class II family members and required for endogenous proteolysis. Based on sequence analysis and hydrophobicity plots, Carson-Walter et al. (2001) hypothesized that TEM5 may be a member of the GPCR superfamily involved in transmitting signals across the cell membrane. The mouse ortholog of TEM5 shares 87% amino acid identity with the human protein. In situ hybridization analysis of human colorectal cancer by Carson-Walter et al. (2001) revealed that TEM5 was expressed clearly in the endothelial cells of the tumor stroma but not in the endothelial cells of normal colonic tissue. The authors used in situ hybridization to examine

Tem5 expression in murine tumors, embryos, and adult tissues. They detected Tem5 in the vasculature of developing embryonic liver and brain as well as in the vessels of transplanted syngeneic and human tumors. In various normal adult mouse tissues, Carson-Walter et al. (2001) detected weak Tem5 expression only in a small fraction of the vessels of brain, heart, intestine, lung, skeletal muscle, and pancreas.

[19654] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19655] Carson-Walter, E. B.; Watkins, D. N.; Nanda, A.; Vogelstein, B.; Kinzler, K. W.; St. Croix, B. : Cell surface tumor endothelial markers are conserved in mice and humans. Cancer Res. 61: 6649-6655, 2001. ; and

[19656] St. Croix, B.; Rago, C.; Velculescu, V.; Traverso, G.; Romans, K. E.; Montgomery, E.; Lal, A.; Riggins, G. J.; Lengauer, C.; Vogelstein, B.; Kinzler, K. W. : Genes expressed in human tu.

[19657] Further studies establishing the function and utilities of TEM5 are found in John Hopkins OMIM database record ID 606823, and in cited publications numbered 689 and 6907 listed in the bibliography section hereinbelow, which

are also hereby incorporated by reference.UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 1 (B3GALT1, Accession NM\_020981) is another VGAM406 host target gene. B3GALT1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by B3GALT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B3GALT1 BINDING SITE, designated SEQ ID:21972, to the nucleotide sequence of VGAM406 RNA, herein designated VGAM RNA, also designated SEQ ID:3117.

[19658] Another function of VGAM406 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 1 (B3GALT1, Accession NM\_020981). Accordingly, utilities of VGAM406 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GALT1. FLJ23816 (Accession NM\_144655) is another VGAM406 host target gene. FLJ23816 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ23816, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of FLJ23816 BINDING SITE, designated SEQ ID:29478, to the nucleotide sequence of VGAM406 RNA, herein designated VGAM RNA, also designated SEQ ID:3117.

[19659] Another function of VGAM406 is therefore inhibition of FLJ23816 (Accession NM\_144655). Accordingly, utilities of VGAM406 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23816. FLJ31737 (Accession NM\_144984) is another VGAM406 host target gene. FLJ31737 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ31737, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31737 BINDING SITE, designated SEQ ID:29589, to the nucleotide sequence of VGAM406 RNA, herein designated VGAM RNA, also designated SEQ ID:3117.

[19660] Another function of VGAM406 is therefore inhibition of FLJ31737 (Accession NM\_144984). Accordingly, utilities of VGAM406 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31737. GLTP (Accession NM\_016433) is another VGAM406 host

target gene. GLTP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GLTP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLTP BINDING SITE, designated SEQ ID:18556, to the nucleotide sequence of VGAM406 RNA, herein designated VGAM RNA, also designated SEQ ID:3117.

[19661] Another function of VGAM406 is therefore inhibition of GLTP (Accession NM\_016433). Accordingly, utilities of VGAM406 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLTP. KIAA0828 (Accession XM\_088105) is another VGAM406 host target gene. KIAA0828 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0828, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0828 BINDING SITE, designated SEQ ID:39515, to the nucleotide sequence of VGAM406 RNA, herein designated VGAM RNA, also designated SEQ ID:3117.

[19662] Another function of VGAM406 is therefore inhibition of KIAA0828 (Accession XM\_088105). Accordingly, utilities of VGAM406 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0828. Pleiomorphic Adenoma Gene-like 2 (PLAGL2, Accession XM\_047007) is another VGAM406 host target gene. PLAGL2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PLAGL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAGL2 BINDING SITE, designated SEQ ID:34875, to the nucleotide sequence of VGAM406 RNA, herein designated VGAM RNA, also designated SEQ ID:3117.

[19663] Another function of VGAM406 is therefore inhibition of Pleiomorphic Adenoma Gene-like 2 (PLAGL2, Accession XM\_047007). Accordingly, utilities of VGAM406 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAGL2. RASD Family, Member 2 (RASD2, Accession NM\_014310) is another VGAM406 host target gene. RASD2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by RASD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASD2 BINDING SITE, designated SEQ ID:15607, to the nucleotide sequence of VGAM406 RNA, herein designated VGAM RNA, also designated SEQ ID:3117.

[19664] Another function of VGAM406 is therefore inhibition of RASD Family, Member 2 (RASD2, Accession NM\_014310). Accordingly, utilities of VGAM406 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASD2. LOC200205 (Accession XM\_114152) is another VGAM406 host target gene. LOC200205 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200205, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200205 BINDING SITE, designated SEQ ID:42737, to the nucleotide sequence of VGAM406 RNA, herein designated VGAM RNA, also designated SEQ ID:3117.

[19665] Another function of VGAM406 is therefore inhibition of

LOC200205 (Accession XM\_114152). Accordingly, utilities of VGAM406 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200205. LOC204084 (Accession XM\_115181) is another VGAM406 host target gene. LOC204084 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC204084, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC204084 BINDING SITE, designated SEQ ID:43084, to the nucleotide sequence of VGAM406 RNA, herein designated VGAM RNA, also designated SEQ ID:3117.

[19666] Another function of VGAM406 is therefore inhibition of LOC204084 (Accession XM\_115181). Accordingly, utilities of VGAM406 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC204084. LOC221632 (Accession XM\_168117) is another VGAM406 host target gene. LOC221632 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221632, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC221632 BINDING SITE, designated SEQ ID:45036, to the nucleotide sequence of VGAM406 RNA, herein designated VGAM RNA, also designated SEQ ID:3117.

[19667] Another function of VGAM406 is therefore inhibition of LOC221632 (Accession XM\_168117). Accordingly, utilities of VGAM406 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221632. LOC90768 (Accession XM\_033986) is another VGAM406 host target gene. LOC90768 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90768, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90768 BINDING SITE, designated SEQ ID:31985, to the nucleotide sequence of VGAM406 RNA, herein designated VGAM RNA, also designated SEQ ID:3117.

[19668] Another function of VGAM406 is therefore inhibition of LOC90768 (Accession XM\_033986). Accordingly, utilities of VGAM406 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90768. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 407 (VGAM407) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19669] VGAM407 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM407 was detected is described hereinabove with reference to Figs. 1–8.

[19670] VGAM407 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melon Necrotic Spot Virus. VGAM407 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19671] VGAM407 gene encodes a VGAM407 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM407 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM407 precursor RNA is designated SEQ ID:393, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:393 is

located at position 1162 relative to the genome of Melon Necrotic Spot Virus.

[19672] VGAM407 precursor RNA folds onto itself, forming VGAM407 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19673] An enzyme complex designated DICER COMPLEX, `dices` the VGAM407 folded precursor RNA into VGAM407 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM407 RNA is designated SEQ ID:3118, and is provided hereinbelow with reference to the sequence listing part.

[19674] VGAM407 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM407 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM407 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[19675] VGAM407 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM407 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM407 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM407 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM407 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[19676] The complementary binding of VGAM407 RNA, herein designated VGAM RNA, to host target binding sites on VGAM407 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM407 host target RNA into VGAM407 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19677] It is appreciated that VGAM407 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM407 host target genes. The mRNA of each one of this plurality of VGAM407 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM407 RNA, herein designated VGAM RNA, and which when bound by VGAM407 RNA causes inhibition of translation of respective one or more VGAM407

host target proteins.

[19678] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM407 gene, herein designated VGAM GENE, on one or more VGAM407 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[19679] It is yet further appreciated that a function of VGAM407 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM407 include diagnosis, prevention and treatment of viral infection by Melon Necrotic Spot Virus.

Specific functions, and accordingly utilities, of VGAM407 correlate with, and may be deduced from, the identity of the host target genes which VGAM407 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19680] Nucleotide sequences of the VGAM407 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM407 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM407 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM407 are further described hereinbelow with reference to Table 1.

[19681] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM407 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM407 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19682] As mentioned hereinabove with reference to Fig. 1, a function of VGAM407 gene, herein designated VGAM is inhibition of expression of VGAM407 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM407 correlate with, and may be deduced from, the identity of the target genes which VGAM407 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19683] Paired Box Gene 2 (PAX2, Accession NM\_003987) is a VGAM407 host target gene. PAX2 BINDING SITE1 and PAX2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PAX2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAX2 BINDING SITE1 and PAX2 BINDING SITE2, designated SEQ ID:10137 and SEQ ID:10143 respectively, to the nucleotide sequence of VGAM407 RNA, herein designated VGAM RNA, also designated SEQ ID:3118.

[19684] A function of VGAM407 is therefore inhibition of Paired Box Gene 2 (PAX2, Accession NM\_003987), a gene which involves in kidney cell differentiation. Accordingly, utilities of VGAM407 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAX2. The function of PAX2 has been established by previous studies. Sanyanusin et al. (1996) obtained the complete genomic structure of the human PAX2 gene. They de-

scribed 5 genomic lambda clones containing human PAX2 gene sequences, 4 of which had previously been reported by them (Sanyanusin et al., 1995). The fifth clone, which included exons 7 and 8, was obtained by Sanyanusin et al. (1996) from a subgenomic lambda cDNA library of size-fractionated EcoRI fragments ranging in size from 6 to 8 kb. Sequencing and restriction mapping of these clones showed that the human PAX2 gene is composed of 12 exons spanning approximately 70 kb. They also found 2 alternatively spliced exons corresponding to exon 10 (Ward et al., 1994) and a 69-bp inserted sequence that they designated as exon 6. The 69-bp insert is homologous to a 69-bp insert reported in the murine Pax2 gene by Dressler et al. (1990). Sanyanusin et al. (1996) identified a (CA)<sub>n</sub> dinucleotide repeat polymorphism in PAX2 which they mapped immediately upstream of exon 9. The PAX2 gene is expressed in primitive cells of the kidney, ureter, eye, ear, and central nervous system. Based on the known expression pattern of PAX2, Sanyanusin et al. (1995) predicted that the phenotype caused by mutations of PAX2 would probably consist of autosomal dominant eye malformations, sensorineural hearing loss, and renal hypoplasia. Pursuing this suspicion, they found deletion of a

single nucleotide in exon 5 of the PAX2 gene (167409.0001) in a father and 3 of his 5 sons who had optic nerve colobomas, renal hypoplasia, mild proteinuria, and vesicoureteral reflux. The nucleotide deletion caused a frameshift in the conserved octapeptide sequence. The phenotype was similar to that of Krd mutant mice which lack a portion of chromosome 19 that is homologous to human 10q24 and includes the Pax2 gene. These mice have reduced thickness of the renal cortex, a reduced number of glomeruli at birth, and reduced amplitudes on electroretinogram. In the Krd mouse, the deletion of chromosome 19 was transgene-induced (Keller et al., 1994). Coloboma of the optic nerve with renal disease (OMIM Ref. No. 120330) is a recognized syndrome. Renal dysplasia and retinal aplasia are combined in the Loken-Senior syndrome (OMIM Ref. No. 266900). Ocular abnormalities occur also with familial juvenile nephronophthisis (OMIM Ref. No. 256100), but that disorder maps to chromosome 2. Animal model experiments lend further support to the function of PAX2. To determine the direct effects of PAX2 mutations on kidney development, fetal kidneys of mice carrying a Pax2(1Neu) mutation were examined. At embryonic day 15 (E15), heterozygous mutant kidneys were

approximately 60% the size of those of wildtype littermates, and the number of nephrons was strikingly reduced. Heterozygous mutant mice showed increased apoptotic cell death during fetal kidney development, but the increased apoptosis was not associated with random stochastic inactivation of Pax2 expression in mutant kidneys; Pax2 was shown to be biallelically expressed during kidney development. The findings supported the conclusion that heterozygous mutations of the PAX2 gene are associated with increased apoptosis and reduced branching of the ureteric bud, due to reduced PAX2 dosage during a critical window in kidney development.

[19685] It is appreciated that the abovementioned animal model for PAX2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[19686] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19687] Sanyanusin, P.; Schimmenti, L. A.; McNoe, L. A.; Ward, T. A.; Pierpont, M. E. M.; Sullivan, M. J.; Dobyns, W. B.; Eccles, M. R. : Mutation of the PAX2 gene in a family with optic nerve colobomas, renal anomalies and vesicoureteral re-

flux. Nature Genet. 9: 358–364, 1995. ; and

[19688] Porteous, S.; Torban, E.; Cho, N.-P.; Cunliffe, H.; Chua, L.; McNoe, L.; Ward, T.; Souza, C.; Gus, P.; Giugliani, R.; Sato, T.; Yun, K.; Favor, J.; Sicotte, M.; Goodyer, P.; Eccles, M.

[19689] Further studies establishing the function and utilities of PAX2 are found in John Hopkins OMIM database record ID 167409, and in cited publications numbered 10331–10334, 10339–10338, 593 and 10708–10718 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA0397 (Accession XM\_029438) is another VGAM407 host target gene. KIAA0397 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0397, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0397 BINDING SITE, designated SEQ ID:30895, to the nucleotide sequence of VGAM407 RNA, herein designated VGAM RNA, also designated SEQ ID:3118.

[19690] Another function of VGAM407 is therefore inhibition of KIAA0397 (Accession XM\_029438). Accordingly, utilities of VGAM407 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0397. KIAA1036 (Accession NM\_014909) is another VGAM407 host target gene. KIAA1036 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1036, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1036 BINDING SITE, designated SEQ ID:17123, to the nucleotide sequence of VGAM407 RNA, herein designated VGAM RNA, also designated SEQ ID:3118.

[19691] Another function of VGAM407 is therefore inhibition of KIAA1036 (Accession NM\_014909). Accordingly, utilities of VGAM407 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1036. Mitogen-activated Protein Kinase 8 Interacting Protein 2 (MAPK8IP2, Accession NM\_016431) is another VGAM407 host target gene. MAPK8IP2 BINDING SITE1 through MAPK8IP2 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MAPK8IP2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of MAPK8IP2 BINDING SITE1 through MAPK8IP2 BINDING SITE3, designated SEQ ID:18551, SEQ ID:14703 and SEQ ID:29154 respectively, to the nucleotide sequence of VGAM407 RNA, herein designated VGAM RNA, also designated SEQ ID:3118.

[19692] Another function of VGAM407 is therefore inhibition of Mitogen-activated Protein Kinase 8 Interacting Protein 2 (MAPK8IP2, Accession NM\_016431). Accordingly, utilities of VGAM407 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPK8IP2. LOC159121 (Accession XM\_099028) is another VGAM407 host target gene. LOC159121 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC159121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159121 BINDING SITE, designated SEQ ID:42066, to the nucleotide sequence of VGAM407 RNA, herein designated VGAM RNA, also designated SEQ ID:3118.

[19693] Another function of VGAM407 is therefore inhibition of LOC159121 (Accession XM\_099028). Accordingly, utilities of VGAM407 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC159121. LOC163682 (Accession XM\_099402) is another VGAM407 host target gene. LOC163682 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC163682, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163682 BINDING SITE, designated SEQ ID:42099, to the nucleotide sequence of VGAM407 RNA, herein designated VGAM RNA, also designated SEQ ID:3118.

[19694] Another function of VGAM407 is therefore inhibition of LOC163682 (Accession XM\_099402). Accordingly, utilities of VGAM407 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163682. LOC51068 (Accession NM\_015938) is another VGAM407 host target gene. LOC51068 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51068, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51068 BINDING SITE, designated SEQ ID:18059, to the

nucleotide sequence of VGAM407 RNA, herein designated VGAM RNA, also designated SEQ ID:3118.

[19695] Another function of VGAM407 is therefore inhibition of LOC51068 (Accession NM\_015938). Accordingly, utilities of VGAM407 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51068. LOC92335 (Accession XM\_044379) is another VGAM407 host target gene. LOC92335 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92335, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92335 BINDING SITE, designated SEQ ID:34192, to the nucleotide sequence of VGAM407 RNA, herein designated VGAM RNA, also designated SEQ ID:3118.

[19696] Another function of VGAM407 is therefore inhibition of LOC92335 (Accession XM\_044379). Accordingly, utilities of VGAM407 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92335. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 408 (VGAM408) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19697] VGAM408 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM408 was detected is described hereinabove with reference to Figs. 1–8.

[19698] VGAM408 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melon Necrotic Spot Virus. VGAM408 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19699] VGAM408 gene encodes a VGAM408 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM408 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM408 precursor RNA is designated SEQ ID:394, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:394 is located at position 266 relative to the genome of Melon Necrotic Spot Virus.

[19700] VGAM408 precursor RNA folds onto itself, forming VGAM408 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19701] An enzyme complex designated DICER COMPLEX, `dices` the VGAM408 folded precursor RNA into VGAM408 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM408 RNA is designated SEQ ID:3119, and is provided hereinbelow with reference to the sequence listing part.

[19702] VGAM408 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM408 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM408 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19703] VGAM408 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM408 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM408 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM408 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM408 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19704] The complementary binding of VGAM408 RNA, herein designated VGAM RNA, to host target binding sites on VGAM408 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM408 host target RNA into VGAM408 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19705] It is appreciated that VGAM408 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM408 host target genes. The mRNA of each one of this plurality of VGAM408 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM408 RNA, herein designated VGAM RNA, and which when bound by VGAM408 RNA causes inhibition of translation of respective one or more VGAM408 host target proteins.

[19706] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM408 gene, herein designated VGAM GENE, on one or more VGAM408 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[19707] It is yet further appreciated that a function of VGAM408 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM408 include diagnosis, prevention and treatment of viral infection by Melon Necrotic Spot Virus. Specific functions, and accordingly utilities, of VGAM408 correlate with, and may be deduced from, the identity of

the host target genes which VGAM408 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [19708] Nucleotide sequences of the VGAM408 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM408 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM408 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM408 are further described hereinbelow with reference to Table 1.
- [19709] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM408 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM408 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [19710] As mentioned hereinabove with reference to Fig. 1, a function of VGAM408 gene, herein designated VGAM is inhibition of expression of VGAM408 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM408 correlate with, and may be deduced from, the identity of the target genes which VGAM408

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19711] A Kinase (PRKA) Anchor Protein 6 (AKAP6, Accession NM\_004274) is a VGAM408 host target gene. AKAP6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AKAP6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP6 BINDING SITE, designated SEQ ID:10488, to the nucleotide sequence of VGAM408 RNA, herein designated VGAM RNA, also designated SEQ ID:3119.

[19712] A function of VGAM408 is therefore inhibition of A Kinase (PRKA) Anchor Protein 6 (AKAP6, Accession NM\_004274). Accordingly, utilities of VGAM408 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP6. Rho Guanine Nucleotide Exchange Factor (GEF) 11 (ARHGEF11, Accession NM\_014784) is another VGAM408 host target gene. ARHGEF11 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ARHGEF11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of ARHGEF11 BINDING SITE, designated SEQ ID:16638, to the nucleotide sequence of VGAM408 RNA, herein designated VGAM RNA, also designated SEQ ID:3119.

[19713] Another function of VGAM408 is therefore inhibition of Rho Guanine Nucleotide Exchange Factor (GEF) 11 (ARHGEF11, Accession NM\_014784). Accordingly, utilities of VGAM408 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF11. LOC149157 (Accession XM\_086442) is another VGAM408 host target gene. LOC149157 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149157, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149157 BINDING SITE, designated SEQ ID:38657, to the nucleotide sequence of VGAM408 RNA, herein designated VGAM RNA, also designated SEQ ID:3119.

[19714] Another function of VGAM408 is therefore inhibition of LOC149157 (Accession XM\_086442). Accordingly, utilities of VGAM408 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC149157. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 409 (VGAM409) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19715] VGAM409 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM409 was detected is described hereinabove with reference to Figs. 1–8.

[19716] VGAM409 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Melon Necrotic Spot Virus. VGAM409 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19717] VGAM409 gene encodes a VGAM409 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM409 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM409 precursor RNA is designated SEQ ID:395, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:395 is located at position 894 relative to the genome of Melon Necrotic Spot Virus.

[19718] VGAM409 precursor RNA folds onto itself, forming VGAM409 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19719] An enzyme complex designated DICER COMPLEX, `dices` the VGAM409 folded precursor RNA into VGAM409 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM409 RNA is designated SEQ ID:3120, and is provided hereinbelow with reference to the sequence listing part.

[19720] VGAM409 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM409 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM409 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19721] VGAM409 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM409 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM409 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM409 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM409 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[19722] The complementary binding of VGAM409 RNA, herein designated VGAM RNA, to host target binding sites on VGAM409 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM409 host target RNA into VGAM409 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19723] It is appreciated that VGAM409 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM409 host target genes. The mRNA of each one of this plurality of VGAM409 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM409 RNA, herein designated VGAM RNA, and which when bound by VGAM409 RNA causes in-

hibition of translation of respective one or more VGAM409 host target proteins.

[19724] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM409 gene, herein designated VGAM GENE, on one or more VGAM409 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[19725] It is yet further appreciated that a function of VGAM409 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM409 include diagnosis, prevention and

treatment of viral infection by Melon Necrotic Spot Virus. Specific functions, and accordingly utilities, of VGAM409 correlate with, and may be deduced from, the identity of the host target genes which VGAM409 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [19726] Nucleotide sequences of the VGAM409 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM409 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM409 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM409 are further described hereinbelow with reference to Table 1.
- [19727] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM409 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM409 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [19728] As mentioned hereinabove with reference to Fig. 1, a function of VGAM409 gene, herein designated VGAM is inhibition of expression of VGAM409 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM409 correlate with, and may be deduced from, the identity of the target genes which VGAM409 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19729] FCRH1 (Accession NM\_052938) is a VGAM409 host target gene. FCRH1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FCRH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FCRH1 BINDING SITE, designated SEQ ID:27498, to the nucleotide sequence of VGAM409 RNA, herein designated VGAM RNA, also designated SEQ ID:3120.

[19730] A function of VGAM409 is therefore inhibition of FCRH1 (Accession NM\_052938). Accordingly, utilities of VGAM409 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FCRH1. SRY (sex determining region Y)-box 4 (SOX4, Accession NM\_003107) is another VGAM409 host target gene. SOX4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SOX4, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOX4 BINDING SITE, designated SEQ ID:9073, to the nucleotide sequence of VGAM409 RNA, herein designated VGAM RNA, also designated SEQ ID:3120.

[19731] Another function of VGAM409 is therefore inhibition of SRY (sex determining region Y)-box 4 (SOX4, Accession NM\_003107), a gene which binds with high affinity to the t-cell enhancer motif 5'-aacaag-3' motif. Accordingly, utilities of VGAM409 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX4. The function of SOX4 has been established by previous studies. SOX4 from both human and mouse was shown by van de Wetering et al. (1993) to be expressed primarily in T and pre-B lymphocyte cell lines. They also showed that the mouse Sox4 protein binds with high affinity to the (A/T)(A/T)CAAAG motif found in several T-cell specific enhancers. By transient expression of chimeric Sox4 constructs, van de Wetering et al. (1993) showed that Sox4 has separable DNA-binding and trans-activation domains. The authors concluded that SOX4 is a lymphocyte-specific transcriptional activator. Using a

yeast 2-hybrid screen, Geijsen et al. (2001) identified the mouse transcriptional factor Sox4 as a binding partner for syntenin (SDCBP; 602217) but not for interleukin-5 receptor-alpha (IL5RA; 147851), which interacts with the PDZ domains of syntenin. The syntenin-Sox4 interaction occurs outside of the PDZ domains of syntenin. Luciferase reporter analysis and fluorescence microscopy showed that IL5 (OMIM Ref. No. 147850), but not IL3 (OMIM Ref. No. 147740), induces cytoplasmic and nuclear expression of syntenin and, in a syntenin- and cytoplasmic IL5RA-dependent manner, of Sox4. Geijsen et al. (2001) concluded that syntenin acts as an adaptor molecule in the IL5RA-mediated activation of SOX4. They also noted that mice lacking either Il5ra or Sox4 have defects in B-cell development

[19732] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19733] Geijsen, N.; Uings, I. J.; Pals, C.; Armstrong, J.; McKinnon, M.; Raaijmakers, J. A. M.; Lammers, J.-W. J.; Koenderman, L.; Coffey, P. J. : Cytokine-specific transcriptional regulation through an IL-5R-alpha interacting protein. Science 293: 1136-1138, 2001. ; and

[19734] Suzuki, T.; Shen, H.; Akagi, K.; Morse, H. C., III; Malley, J. D.; Naiman, D. Q.; Jenkins, N. A.; Copeland, N. G. : New genes involved in cancer identified by retroviral tagging. Nature.

[19735] Further studies establishing the function and utilities of SOX4 are found in John Hopkins OMIM database record ID 184430, and in cited publications numbered 12406–12408, 346 and 12409–12413 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Timeless Homolog (Drosophila) (TIMELESS, Accession NM\_003920) is another VGAM409 host target gene. TIMELESS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIMELESS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIMELESS BINDING SITE, designated SEQ ID:10005, to the nucleotide sequence of VGAM409 RNA, herein designated VGAM RNA, also designated SEQ ID:3120.

[19736] Another function of VGAM409 is therefore inhibition of Timeless Homolog (Drosophila) (TIMELESS, Accession NM\_003920), a gene which involves in circadian oscilla-

tion autoregulation. Accordingly, utilities of VGAM409 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIMELESS. The function of TIMELESS has been established by previous studies. Cellular pacemakers located in the suprachiasmatic nucleus (SCN) of the anterior hypothalamus control circadian rhythms. In *Drosophila*, a central clock mechanism involves the dynamic regulation of 2 genes, 'period' (per; OMIM Ref. No. 602260) and 'timeless' (tim), which physically interact and participate in an intracellular transcriptional/translational feedback loop. The transcription of per and tim is positively regulated by the Clock (OMIM Ref. No. 601851) and BMAL1 (OMIM Ref. No. 602550) proteins, which form heterodimers. By searching EST databases, Sangoram et al. (1998), Zylka et al. (1998), and Koike et al. (1998) identified cDNAs corresponding to human (TIM) and mouse (Tim) homologs of *Drosophila* timeless. Sangoram et al. (1998) reported that the predicted 1,208-amino acid human protein is 84% identical to mouse Tim. The mammalian proteins share 4 regions of homology with *Drosophila* tim, including regions involved in nuclear localization, protein-protein interaction with PER, and cytoplasmic localization. Northern blot analysis

revealed that TIM was expressed as a 4.5-kb mRNA in all human tissues tested, with the highest levels in placenta, pancreas, thymus, and testis. In situ hybridization indicated that unlike those of *Drosophila*, mouse Tim transcript levels do not oscillate in the SCN or in the retina. Sangoram et al. (1998) demonstrated that human TIM interacts with *Drosophila* per, mouse PER1, and mouse PER2 (see OMIM Ref. No. 603426) in vitro. When expressed in *Drosophila* cells, TIM mimicked a *Drosophila* tim cellular function by interacting with *Drosophila* per and translocating into the nucleus. In addition, when expressed in mammalian cells, human TIM and mouse PER1 specifically inhibited CLOCK-BMAL1-induced transactivation of the mouse PER1 promoter. These authors concluded that TIM and Tim are the mammalian orthologs of *Drosophila* tim. In contrast, Zylka et al. (1998) were unable to detect mouse Per-Tim interactions in yeast 2-hybrid assays. They found an array of interactions between the various mouse Per proteins, and suggested that Per-Per interactions have replaced the function of Per-Tim dimers in the molecular workings of the mammalian circadian clock.

[19737] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [19738] Sangoram, A. M.; Saez, L.; Antoch, M. P.; Gekakis, N.; Staknis, D.; Whiteley, A.; Fruechte, E. M.; Vitaterna, M. H.; Shimomura, K.; King, D. P.; Young, M. W.; Weitz, C. J.; Takahashi, J. S. : Mammalian circadian autoregulatory loop: a timeless ortholog and mPer1 interact and negatively regulate CLOCK-BMAL1-induced transcription. *Neuron* 21: 1101-1113, 1998. ; and

- [19740] Further studies establishing the function and utilities of TIMELESS are found in John Hopkins OMIM database record ID 603887, and in cited publications numbered 7627-7629 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ10508 (Accession NM\_018118) is another VGAM409 host target gene. FLJ10508 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ10508, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10508 BINDING SITE, designated

SEQ ID:19889, to the nucleotide sequence of VGAM409 RNA, herein designated VGAM RNA, also designated SEQ ID:3120.

[19741] Another function of VGAM409 is therefore inhibition of FLJ10508 (Accession NM\_018118). Accordingly, utilities of VGAM409 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10508. FLJ10724 (Accession NM\_018194) is another VGAM409 host target gene. FLJ10724 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10724, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10724 BINDING SITE, designated SEQ ID:20054, to the nucleotide sequence of VGAM409 RNA, herein designated VGAM RNA, also designated SEQ ID:3120.

[19742] Another function of VGAM409 is therefore inhibition of FLJ10724 (Accession NM\_018194). Accordingly, utilities of VGAM409 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10724. FLJ11320 (Accession NM\_018389) is another VGAM409 host target gene. FLJ11320 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by FLJ11320, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11320 BINDING SITE, designated SEQ ID:20425, to the nucleotide sequence of VGAM409 RNA, herein designated VGAM RNA, also designated SEQ ID:3120.

[19743] Another function of VGAM409 is therefore inhibition of FLJ11320 (Accession NM\_018389). Accordingly, utilities of VGAM409 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11320. FLJ13912 (Accession NM\_022770) is another VGAM409 host target gene. FLJ13912 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13912, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13912 BINDING SITE, designated SEQ ID:23026, to the nucleotide sequence of VGAM409 RNA, herein designated VGAM RNA, also designated SEQ ID:3120.

[19744] Another function of VGAM409 is therefore inhibition of

FLJ13912 (Accession NM\_022770). Accordingly, utilities of VGAM409 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13912. FLJ32356 (Accession NM\_144671) is another VGAM409 host target gene. FLJ32356 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ32356, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32356 BINDING SITE, designated SEQ ID:29492, to the nucleotide sequence of VGAM409 RNA, herein designated VGAM RNA, also designated SEQ ID:3120.

[19745] Another function of VGAM409 is therefore inhibition of FLJ32356 (Accession NM\_144671). Accordingly, utilities of VGAM409 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32356. Nudix (nucleoside diphosphate linked moiety X)-type Motif 11 (NUDT11, Accession XM\_010230) is another VGAM409 host target gene. NUDT11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NUDT11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUDT11 BINDING SITE, designated SEQ ID:30139, to the nucleotide sequence of VGAM409 RNA, herein designated VGAM RNA, also designated SEQ ID:3120.

[19746] Another function of VGAM409 is therefore inhibition of Nudix (nucleoside diphosphate linked moiety X)-type Motif 11 (NUDT11, Accession XM\_010230). Accordingly, utilities of VGAM409 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUDT11. LOC256997 (Accession XM\_170900) is another VGAM409 host target gene. LOC256997 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256997, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256997 BINDING SITE, designated SEQ ID:45651, to the nucleotide sequence of VGAM409 RNA, herein designated VGAM RNA, also designated SEQ ID:3120.

[19747] Another function of VGAM409 is therefore inhibition of LOC256997 (Accession XM\_170900). Accordingly, utilities of VGAM409 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC256997. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 410 (VGAM410) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19748] VGAM410 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM410 was detected is described hereinabove with reference to Figs. 1–8.

[19749] VGAM410 gene, herein designated VGAM GENE, is a viral gene contained in the genome of O'nyong–nyong Virus. VGAM410 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19750] VGAM410 gene encodes a VGAM410 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM410 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM410 precursor RNA is designated SEQ

ID:396, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:396 is located at position 5873 relative to the genome of O'nyong-nyong Virus.

[19751] VGAM410 precursor RNA folds onto itself, forming VGAM410 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19752] An enzyme complex designated DICER COMPLEX, `dices` the VGAM410 folded precursor RNA into VGAM410 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM410 RNA is designated SEQ ID:3121, and is provided hereinbelow with reference to the sequence

listing part.

[19753] VGAM410 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM410 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM410 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19754] VGAM410 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM410 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM410 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM410 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM410 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19755] The complementary binding of VGAM410 RNA, herein designated VGAM RNA, to host target binding sites on VGAM410 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM410 host target RNA into VGAM410 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19756] It is appreciated that VGAM410 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM410 host target genes. The mRNA of each one of this plurality of VGAM410 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM410 RNA, herein designated VGAM

RNA, and which when bound by VGAM410 RNA causes inhibition of translation of respective one or more VGAM410 host target proteins.

[19757] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM410 gene, herein designated VGAM GENE, on one or more VGAM410 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[19758] It is yet further appreciated that a function of VGAM410 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM410 include diagnosis, prevention and treatment of viral infection by O'nyong-nyong Virus. Specific functions, and accordingly utilities, of VGAM410 correlate with, and may be deduced from, the identity of the host target genes which VGAM410 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [19759] Nucleotide sequences of the VGAM410 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM410 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM410 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM410 are further described hereinbelow with reference to Table 1.
- [19760] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM410 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM410 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [19761] As mentioned hereinabove with reference to Fig. 1, a function of VGAM410 gene, herein designated VGAM is

inhibition of expression of VGAM410 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM410 correlate with, and may be deduced from, the identity of the target genes which VGAM410 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19762] Carbohydrate (keratan sulfate Gal-6) Sulfotransferase 1 (CHST1, Accession NM\_003654) is a VGAM410 host target gene. CHST1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CHST1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHST1 BINDING SITE, designated SEQ ID:9729, to the nucleotide sequence of VGAM410 RNA, herein designated VGAM RNA, also designated SEQ ID:3121.

[19763] A function of VGAM410 is therefore inhibition of Carbohydrate (keratan sulfate Gal-6) Sulfotransferase 1 (CHST1, Accession NM\_003654), a gene which may play a role in keratan sulfate biosynthesis in brain and cornea. Accordingly, utilities of VGAM410 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with CHST1. The function of CHST1 has been established by previous studies. The keratan sulfate proteoglycans lumican and keratocan are the major proteoglycans in the cornea and are thought to play an important role in corneal transparency. Sulfation appears to be important for the biologic function of keratan sulfate, because undersulfated keratan sulfate is synthesized in patients with macular corneal dystrophy (see OMIM Ref. No. 217800). Keratan sulfate bears sulfate groups on both N-acetylglucosamine (OMIM Ref. No. GlcNAc) and galactose residues. Fukuta et al. (1997) stated that C6ST (chondroitin 6-sulfotransferase; 603799) catalyzes sulfation of chondroitin and keratan sulfate. However, in developing cornea, keratan sulfate is actively synthesized while chondroitin 6-sulfate synthesis is minimal, suggesting that a different sulfotransferase is present in cornea with specificity towards keratan sulfate. By screening a human fetal brain library with a chick C6ST cDNA, Fukuta et al. (1997) isolated cDNAs encoding C6ST and keratan sulfate gal-6-sulfotransferase (KSGal6ST). Northern blot analysis revealed that the 2.8-kb KSGal6ST mRNA was expressed in human brain and in chick brain and cornea. A slightly larger and less abundant transcript was observed

in human skeletal muscle. The predicted 411-amino acid KSGal6ST shares 37% sequence identity with chick C6ST. When the KSGal6ST cDNA was expressed in COS-7 cells, keratan sulfate sulfotransferase activity increased, but C6ST activity did not. In vitro, the partially purified KS-Gal6ST protein showed substrate specificity towards keratan sulfate; KSGal6ST could not utilize chondroitin as an acceptor. Fukuta et al. (1997) concluded that KSGal6ST may participate in the biosynthesis of keratan sulfate in the brain and cornea. Independently, Mazany et al. (1998) cloned genomic DNA and cDNAs corresponding to CHST1, which they called C6ST. These authors found that stable expression of the CHST1 cDNA in CHO cells increased both C6ST and keratan sulfate sulfotransferase activities. Mazany et al. (1998) suggested that the distinct pattern of CHST1 enzyme activity observed by Fukuta et al. (1997) may be due to differences between the mammalian cell lines used by the 2 groups to express the enzyme.

[19764] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19765] Iida, A.; Saito, S.; Sekine, A.; Mishima, C.; Kitamura, Y.; Kondo, K.; Harigae, S.; Osawa, S.; Nakamura, Y. : Catalog

of 77 single-nucleotide polymorphisms (SNPs) in the carbohydrate sulfotransferase 1 (CHST1) and carbohydrate sulfotransferase 3 (CHST3) genes. J. Hum. Genet. 47: 14–19, 2002. ; and

[19766] Mazany, K. D.; Peng, T.; Watson, C. E.; Tabas, I.; Williams, K. J. : Human chondroitin 6-sulfotransferase: cloning, gene structure, and chromosomal localization. Biochim. Biophys. Acta.

[19767] Further studies establishing the function and utilities of CHST1 are found in John Hopkins OMIM database record ID 603797, and in cited publications numbered 994–996 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.FLJ11539 (Accession NM\_024748) is another VGAM410 host target gene. FLJ11539 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11539, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11539 BINDING SITE, designated SEQ ID:24084, to the nucleotide sequence of VGAM410 RNA, herein designated VGAM RNA, also designated SEQ ID:3121.

[19768] Another function of VGAM410 is therefore inhibition of FLJ11539 (Accession NM\_024748). Accordingly, utilities of VGAM410 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11539. FLJ23511 (Accession NM\_032239) is another VGAM410 host target gene. FLJ23511 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23511, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23511 BINDING SITE, designated SEQ ID:25964, to the nucleotide sequence of VGAM410 RNA, herein designated VGAM RNA, also designated SEQ ID:3121.

[19769] Another function of VGAM410 is therefore inhibition of FLJ23511 (Accession NM\_032239). Accordingly, utilities of VGAM410 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23511. PRO1866 (Accession NM\_018510) is another VGAM410 host target gene. PRO1866 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO1866, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1866 BINDING SITE, designated SEQ ID:20578, to the nucleotide sequence of VGAM410 RNA, herein designated VGAM RNA, also designated SEQ ID:3121.

[19770] Another function of VGAM410 is therefore inhibition of PRO1866 (Accession NM\_018510). Accordingly, utilities of VGAM410 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1866. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 411 (VGAM411) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19771] VGAM411 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM411 was detected is described hereinabove with reference to Figs. 1–8.

[19772] VGAM411 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Igbo Ora Virus. VGAM411 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[19773] VGAM411 gene encodes a VGAM411 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM411 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM411 precursor RNA is designated SEQ ID:397, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:397 is located at position 3184 relative to the genome of Igbo Ora Virus.

[19774] VGAM411 precursor RNA folds onto itself, forming VGAM411 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19775] An enzyme complex designated DICER COMPLEX, `dices` the VGAM411 folded precursor RNA into VGAM411 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM411 RNA is designated SEQ ID:3122, and is provided hereinbelow with reference to the sequence listing part.

[19776] VGAM411 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM411 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM411 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19777] VGAM411 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM411 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM411 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM411 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM411 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19778] The complementary binding of VGAM411 RNA, herein designated VGAM RNA, to host target binding sites on VGAM411 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM411 host target RNA into VGAM411 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19779] It is appreciated that VGAM411 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM411 host target genes. The mRNA of each one of this plurality of VGAM411 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM411 RNA, herein designated VGAM RNA, and which when bound by VGAM411 RNA causes inhibition of translation of respective one or more VGAM411 host target proteins.

[19780] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM411 gene, herein designated VGAM GENE, on one or more VGAM411 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[19781] It is yet further appreciated that a function of VGAM411 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM411 include diagnosis, prevention and treatment of viral infection by Igbo Ora Virus. Specific functions, and accordingly utilities, of VGAM411 correlate with, and may be deduced from, the identity of the host target genes which VGAM411 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19782] Nucleotide sequences of the VGAM411 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM411 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM411 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM411 are further described hereinbelow with reference to Table 1.

[19783] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM411 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM411 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19784] As mentioned hereinabove with reference to Fig. 1, a function of VGAM411 gene, herein designated VGAM is inhibition of expression of VGAM411 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM411 correlate with, and may be deduced from, the identity of the target genes which VGAM411 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19785] Nuclear Mitotic Apparatus Protein 1 (NUMA1, Accession XM\_167853) is a VGAM411 host target gene. NUMA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NUMA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUMA1 BINDING SITE, designated SEQ ID:44881, to the nucleotide sequence of VGAM411 RNA, herein designated VGAM RNA, also designated SEQ ID:3122.

[19786] A function of VGAM411 is therefore inhibition of Nuclear Mitotic Apparatus Protein 1 (NUMA1, Accession XM\_167853), a gene which is nuclear mitotic apparatus protein. Accordingly, utilities of VGAM411 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NUMA1. The function of NUMA1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM192.FLJ14642 (Accession NM\_032818) is another VGAM411 host target gene. FLJ14642 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14642, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14642 BINDING SITE, designated SEQ ID:26595, to the nucleotide sequence of VGAM411 RNA, herein designated VGAM RNA, also designated SEQ ID:3122.

[19787] Another function of VGAM411 is therefore inhibition of FLJ14642 (Accession NM\_032818). Accordingly, utilities of VGAM411 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14642.

KIAA1084 (Accession NM\_014910) is another VGAM411 host target gene. KIAA1084 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1084, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1084 BINDING SITE, designated SEQ ID:17139, to the nucleotide sequence of VGAM411 RNA, herein designated VGAM RNA, also designated SEQ ID:3122.

[19788] Another function of VGAM411 is therefore inhibition of KIAA1084 (Accession NM\_014910). Accordingly, utilities of VGAM411 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1084. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 412 (VGAM412) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19789] VGAM412 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM412 was detected is described hereinabove with reference to Figs. 1–8.

[19790] VGAM412 gene, herein designated VGAM GENE, is a viral gene contained in the genome of O'nyong–nyong Virus.

VGAM412 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19791] VGAM412 gene encodes a VGAM412 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM412 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM412 precursor RNA is designated SEQ ID:398, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:398 is located at position 4500 relative to the genome of O'nyong–nyong Virus.

[19792] VGAM412 precursor RNA folds onto itself, forming VGAM412 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two–dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19793] An enzyme complex designated DICER COMPLEX, `dices` the VGAM412 folded precursor RNA into VGAM412 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 67%) nucleotide sequence of VGAM412 RNA is designated SEQ ID:3123, and is provided hereinbelow with reference to the sequence listing part.

[19794] VGAM412 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM412 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM412 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19795] VGAM412 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM412 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM412 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM412 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM412 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[19796] The complementary binding of VGAM412 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM412 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM412 host target RNA into VGAM412 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19797] It is appreciated that VGAM412 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM412 host target genes. The mRNA of each one of this plurality of VGAM412 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM412 RNA, herein designated VGAM RNA, and which when bound by VGAM412 RNA causes inhibition of translation of respective one or more VGAM412 host target proteins.

[19798] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM412 gene, herein designated VGAM GENE, on one or more VGAM412 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[19799] It is yet further appreciated that a function of VGAM412 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM412 include diagnosis, prevention and treatment of viral infection by O'nyong-nyong Virus. Specific functions, and accordingly utilities, of VGAM412 correlate with, and may be deduced from, the identity of the host target genes which VGAM412 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19800] Nucleotide sequences of the VGAM412 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM412 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM412 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM412 are further described hereinbelow with reference to Table 1.

[19801] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM412 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM412 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19802] As mentioned hereinabove with reference to Fig. 1, a function of VGAM412 gene, herein designated VGAM is inhibition of expression of VGAM412 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM412 correlate with, and may be deduced from, the identity of the target genes which VGAM412 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19803] Deafness, Autosomal Dominant 5 (DFNA5, Accession NM\_004403) is a VGAM412 host target gene. DFNA5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DFNA5, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DFNA5 BINDING SITE, designated SEQ ID:10655, to the nucleotide sequence of VGAM412 RNA, herein designated VGAM RNA, also designated SEQ ID:3123.

[19804] A function of VGAM412 is therefore inhibition of Deafness, Autosomal Dominant 5 (DFNA5, Accession NM\_004403). Accordingly, utilities of VGAM412 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DFNA5. ATPase, H<sup>+</sup> Transporting, Lysosomal 56/58kDa, V1 Subunit B, Isoform 2 (ATP6V1B2, Accession NM\_001693) is another VGAM412 host target gene. ATP6V1B2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP6V1B2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP6V1B2 BINDING SITE, designated SEQ ID:7413, to the nucleotide sequence of VGAM412 RNA, herein designated VGAM RNA, also designated SEQ ID:3123.

[19805] Another function of VGAM412 is therefore inhibition of

ATPase, H<sup>+</sup> Transporting, Lysosomal 56/58kDa, V1 Sub-unit B, Isoform 2 (ATP6V1B2, Accession NM\_001693). Accordingly, utilities of VGAM412 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP6V1B2. FLJ11053 (Accession XM\_114194) is another VGAM412 host target gene. FLJ11053 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11053, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11053 BINDING SITE, designated SEQ ID:42778, to the nucleotide sequence of VGAM412 RNA, herein designated VGAM RNA, also designated SEQ ID:3123.

[19806] Another function of VGAM412 is therefore inhibition of FLJ11053 (Accession XM\_114194). Accordingly, utilities of VGAM412 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11053. KIAA0478 (Accession NM\_014870) is another VGAM412 host target gene. KIAA0478 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0478, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0478 BINDING SITE, designated SEQ ID:16988, to the nucleotide sequence of VGAM412 RNA, herein designated VGAM RNA, also designated SEQ ID:3123.

[19807] Another function of VGAM412 is therefore inhibition of KIAA0478 (Accession NM\_014870). Accordingly, utilities of VGAM412 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0478. KIAA1404 (Accession XM\_030494) is another VGAM412 host target gene. KIAA1404 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1404, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1404 BINDING SITE, designated SEQ ID:31052, to the nucleotide sequence of VGAM412 RNA, herein designated VGAM RNA, also designated SEQ ID:3123.

[19808] Another function of VGAM412 is therefore inhibition of KIAA1404 (Accession XM\_030494). Accordingly, utilities of VGAM412 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1404. LanC Lantibiotic Synthetase Component C-like 2 (bacterial) (LANCL2, Accession NM\_018697) is another VGAM412 host target gene. LANCL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LANCL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LANCL2 BINDING SITE, designated SEQ ID:20780, to the nucleotide sequence of VGAM412 RNA, herein designated VGAM RNA, also designated SEQ ID:3123.

[19809] Another function of VGAM412 is therefore inhibition of LanC Lantibiotic Synthetase Component C-like 2 (bacterial) (LANCL2, Accession NM\_018697). Accordingly, utilities of VGAM412 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LANCL2. OS-9 (Accession NM\_006812) is another VGAM412 host target gene. OS-9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OS-9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OS-9 BINDING SITE, designated SEQ ID:20781, to the nucleotide sequence of VGAM412 RNA, herein designated VGAM RNA, also designated SEQ ID:3123.

tarity of the nucleotide sequences of OS-9 BINDING SITE, designated SEQ ID:13682, to the nucleotide sequence of VGAM412 RNA, herein designated VGAM RNA, also designated SEQ ID:3123.

[19810] Another function of VGAM412 is therefore inhibition of OS-9 (Accession NM\_006812). Accordingly, utilities of VGAM412 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OS-9. PRO1483 (Accession NM\_018582) is another VGAM412 host target gene. PRO1483 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO1483, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1483 BINDING SITE, designated SEQ ID:20660, to the nucleotide sequence of VGAM412 RNA, herein designated VGAM RNA, also designated SEQ ID:3123.

[19811] Another function of VGAM412 is therefore inhibition of PRO1483 (Accession NM\_018582). Accordingly, utilities of VGAM412 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1483. RASD Family, Member 2 (RASD2, Accession NM\_014310)

is another VGAM412 host target gene. RASD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RASD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RASD2 BINDING SITE, designated SEQ ID:15604, to the nucleotide sequence of VGAM412 RNA, herein designated VGAM RNA, also designated SEQ ID:3123.

[19812] Another function of VGAM412 is therefore inhibition of RASD Family, Member 2 (RASD2, Accession NM\_014310). Accordingly, utilities of VGAM412 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RASD2. LOC132332 (Accession XM\_072306) is another VGAM412 host target gene. LOC132332 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC132332, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC132332 BINDING SITE, designated SEQ ID:37486, to the nucleotide sequence of VGAM412 RNA, herein designated VGAM RNA, also design-

nated SEQ ID:3123.

[19813] Another function of VGAM412 is therefore inhibition of LOC132332 (Accession XM\_072306). Accordingly, utilities of VGAM412 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132332. LOC92148 (Accession XM\_043160) is another VGAM412 host target gene. LOC92148 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92148, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92148 BINDING SITE, designated SEQ ID:33910, to the nucleotide sequence of VGAM412 RNA, herein designated VGAM RNA, also designated SEQ ID:3123.

[19814] Another function of VGAM412 is therefore inhibition of LOC92148 (Accession XM\_043160). Accordingly, utilities of VGAM412 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92148. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 413 (VGAM413) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19815] VGAM413 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM413 was detected is described hereinabove with reference to Figs. 1–8.

[19816] VGAM413 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pepper Mottle Virus. VGAM413 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19817] VGAM413 gene encodes a VGAM413 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM413 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM413 precursor RNA is designated SEQ ID:399, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:399 is located at position 7131 relative to the genome of Pepper Mottle Virus.

[19818] VGAM413 precursor RNA folds onto itself, forming

VGAM413 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19819] An enzyme complex designated DICER COMPLEX, `dices` the VGAM413 folded precursor RNA into VGAM413 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM413 RNA is designated SEQ ID:3124, and is provided hereinbelow with reference to the sequence listing part.

[19820] VGAM413 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM413 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM413 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19821] VGAM413 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM413 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM413 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM413 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM413 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19822] The complementary binding of VGAM413 RNA, herein designated VGAM RNA, to host target binding sites on VGAM413 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM413 host target RNA into VGAM413 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19823] It is appreciated that VGAM413 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM413 host target genes. The mRNA of each one of this plurality of VGAM413 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM413 RNA, herein designated VGAM RNA, and which when bound by VGAM413 RNA causes inhibition of translation of respective one or more VGAM413 host target proteins.

[19824] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM413 gene, herein designated VGAM GENE, on one or more VGAM413 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[19825] It is yet further appreciated that a function of VGAM413 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM413 include diagnosis, prevention and treatment of viral infection by Pepper Mottle Virus. Specific functions, and accordingly utilities, of VGAM413 correlate with, and may be deduced from, the identity of the host target genes which VGAM413 binds and inhibits, and

the function of these host target genes, as elaborated hereinbelow.

[19826] Nucleotide sequences of the VGAM413 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM413 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM413 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM413 are further described hereinbelow with reference to Table 1.

[19827] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM413 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM413 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19828] As mentioned hereinabove with reference to Fig. 1, a function of VGAM413 gene, herein designated VGAM is inhibition of expression of VGAM413 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM413 correlate with, and may be deduced from, the identity of the target genes which VGAM413 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[19829] Eukaryotic Translation Initiation Factor 2C, 1 (EIF2C1, Accession NM\_012199) is a VGAM413 host target gene. EIF2C1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF2C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF2C1 BINDING SITE, designated SEQ ID:14502, to the nucleotide sequence of VGAM413 RNA, herein designated VGAM RNA, also designated SEQ ID:3124.

[19830] A function of VGAM413 is therefore inhibition of Eukaryotic Translation Initiation Factor 2C, 1 (EIF2C1, Accession NM\_012199), a gene which plays an important role in the eukaryotic peptide chain initiation process. Accordingly, utilities of VGAM413 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF2C1. The function of EIF2C1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM118.G Protein-coupled Receptor 81 (GPR81, Accession NM\_032554) is another VGAM413

host target gene. GPR81 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPR81, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR81 BINDING SITE, designated SEQ ID:26282, to the nucleotide sequence of VGAM413 RNA, herein designated VGAM RNA, also designated SEQ ID:3124.

[19831] Another function of VGAM413 is therefore inhibition of G Protein-coupled Receptor 81 (GPR81, Accession NM\_032554). Accordingly, utilities of VGAM413 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR81. Potassium Voltage-gated Channel, Shaker-related Subfamily, Member 5 (KCNA5, Accession XM\_006988) is another VGAM413 host target gene. KCNA5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNA5 BINDING SITE, designated SEQ ID:30028, to the nucleotide sequence of VGAM413

RNA, herein designated VGAM RNA, also designated SEQ ID:3124.

[19832] Another function of VGAM413 is therefore inhibition of Potassium Voltage-gated Channel, Shaker-related Subfamily, Member 5 (KCNA5, Accession XM\_006988), a gene which mediates the voltage-dependent potassium ion permeability of excitable membranes. Accordingly, utilities of VGAM413 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNA5. The function of KCNA5 has been established by previous studies. Potassium channels play an important role in the regulation of pancreatic beta cells in response to glucose and the sulfonylurea oral hypoglycemic agents. Philipson et al. (1991) used a rat brain potassium channel probe to screen a human insulinoma cDNA library for clones encoding voltage-gated potassium channels. They isolated a series of cDNA clones which were then used to isolate and sequence a potassium channel gene, designated PCN1. Microinjection of synthetic RNA encoding PCN1 was accomplished in order to determine the electrophysiologic characteristics of the protein. These experiments demonstrated that the PCN1 potassium channel has the electrophysiologic characteristics of delayed-rec-

tifier type channels. Tamkun et al. (1991) isolated human heart cDNAs encoding PCN1, which they called HK2, and HK1 (KCNA4; 176266). They reported that the predicted 605-amino acid HK2 protein shares the characteristics of voltage-gated potassium channels, with 6 potential membrane-spanning domains and a positively charged region in the fourth membrane-spanning domain. Northern blot analysis revealed that HK2 is expressed as a major 2.5- and a minor 1.5-kb mRNA in human atrium and ventricle. By study of somatic cell hybrids, McPherson et al. (1991) mapped a Shaker-related potassium voltage-gated channel gene to chromosome 12. Designated here KCNA5, the gene was identified with probe Kv1 from the rat. By multipoint linkage analysis of 8 CEPH families, Phromchotikul et al. (1993) mapped the KCNA5 gene to 12p and determined its position relative to 4 DNA markers. Using interspecific backcrosses between *Mus musculus* and *Mus spretus*, Klocke et al. (1993) mapped the *Kcna5* gene to a cluster with the *Kcna1* and *Kcna6* (OMIM Ref. No. 176257) genes and the mouse homolog of TPI1 (OMIM Ref. No. 190450). Since TPI1 is located on band 12p13 in the human, the 3 K(+)-channel genes was predicted to be in the same band. Curran et al. (1992) mapped the KCNA5 gene,

which they erroneously referred to as the KCNA1 gene, to chromosome 12 by use of human–rodent somatic cell panels and narrowed the localization to the distal short arm by in situ hybridization. Linkage studies had shown a maximum lod score of 2.72 at a recombination fraction of 0.05 between KCNA5 and the von Willebrand locus (VWF; 193400). Albrecht et al. (1995) determined that a 300–kb cluster on chromosome 12p13 contains the human KCNA6, KCNA1, and KCNA5 genes arranged in tandem

[19833] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19834] Albrecht, B.; Weber, K.; Pongs, O. : Characterization of a voltage–activated K–channel gene cluster on human chromosome 12p13. *Receptors Channels* 3: 213–220, 1995. ; and

[19835] Curran, M. E.; Landes, G. M.; Keating, M. T. : Molecular cloning, characterization, and genomic localization of a human potassium channel gene. *Genomics* 12: 729–737, 1992.

[19836] Further studies establishing the function and utilities of KCNA5 are found in John Hopkins OMIM database record ID 176267, and in cited publications numbered 10288,

10291, 1092 and 10939 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Lipin 1 (LPIN1, Accession XM\_041136) is another VGAM413 host target gene. LPIN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LPIN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LPIN1 BINDING SITE, designated SEQ ID:33467, to the nucleotide sequence of VGAM413 RNA, herein designated VGAM RNA, also designated SEQ ID:3124.

[19837] Another function of VGAM413 is therefore inhibition of Lipin 1 (LPIN1, Accession XM\_041136), a gene which is involved in adipocyte differentiation (by similarity). Accordingly, utilities of VGAM413 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LPIN1. The function of LPIN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM35. Pleiomorphic Adenoma Gene 1 (PLAG1, Accession NM\_002655) is another VGAM413 host target gene. PLAG1 BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by PLAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAG1 BINDING SITE, designated SEQ ID:8520, to the nucleotide sequence of VGAM413 RNA, herein designated VGAM RNA, also designated SEQ ID:3124.

[19838] Another function of VGAM413 is therefore inhibition of Pleiomorphic Adenoma Gene 1 (PLAG1, Accession NM\_002655), a gene which contains a zinc finger domain. Accordingly, utilities of VGAM413 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAG1. The function of PLAG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM29. Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase Activation Protein, Gamma Polypeptide (YWHAG, Accession NM\_012479) is another VGAM413 host target gene. YWHAG BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by YWHAG, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YWHAG BINDING SITE, designated SEQ ID:14855, to the nucleotide sequence of VGAM413 RNA, herein designated VGAM RNA, also designated SEQ ID:3124.

[19839] Another function of VGAM413 is therefore inhibition of Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase Activation Protein, Gamma Polypeptide (YWHAG, Accession NM\_012479), a gene which mediates mitogenic signals of PDGF in vascular smooth muscle cells. Accordingly, utilities of VGAM413 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YWHAG. The function of YWHAG and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM180.Chromosome 1 Open Reading Frame 22 (C1orf22, Accession NM\_025191) is another VGAM413 host target gene. C1orf22 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1orf22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf22 BINDING SITE, designated SEQ ID:24837, to the nucleotide sequence of VGAM413 RNA, herein designated VGAM RNA, also designated SEQ ID:3124.

[19840] Another function of VGAM413 is therefore inhibition of Chromosome 1 Open Reading Frame 22 (C1orf22, Accession NM\_025191). Accordingly, utilities of VGAM413 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf22. FLJ10246 (Accession NM\_018038) is another VGAM413 host target gene. FLJ10246 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10246, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10246 BINDING SITE, designated SEQ ID:19785, to the nucleotide sequence of VGAM413 RNA, herein designated VGAM RNA, also designated SEQ ID:3124.

[19841] Another function of VGAM413 is therefore inhibition of FLJ10246 (Accession NM\_018038). Accordingly, utilities of VGAM413 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ10246. FLJ10276 (Accession NM\_018045) is another VGAM413 host target gene. FLJ10276 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10276 BINDING SITE, designated SEQ ID:19791, to the nucleotide sequence of VGAM413 RNA, herein designated VGAM RNA, also designated SEQ ID:3124.

[19842] Another function of VGAM413 is therefore inhibition of FLJ10276 (Accession NM\_018045). Accordingly, utilities of VGAM413 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10276. FLJ12700 (Accession NM\_024910) is another VGAM413 host target gene. FLJ12700 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12700, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12700 BINDING SITE, designated SEQ ID:24415, to the nucleotide sequence of

VGAM413 RNA, herein designated VGAM RNA, also designated SEQ ID:3124.

[19843] Another function of VGAM413 is therefore inhibition of FLJ12700 (Accession NM\_024910). Accordingly, utilities of VGAM413 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12700. G2 (Accession XM\_039515) is another VGAM413 host target gene. G2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by G2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of G2 BINDING SITE, designated SEQ ID:33112, to the nucleotide sequence of VGAM413 RNA, herein designated VGAM RNA, also designated SEQ ID:3124.

[19844] Another function of VGAM413 is therefore inhibition of G2 (Accession XM\_039515). Accordingly, utilities of VGAM413 include diagnosis, prevention and treatment of diseases and clinical conditions associated with G2. KIAA1655 (Accession XM\_039442) is another VGAM413 host target gene. KIAA1655 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1655, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1655 BINDING SITE, designated SEQ ID:33087, to the nucleotide sequence of VGAM413 RNA, herein designated VGAM RNA, also designated SEQ ID:3124.

[19845] Another function of VGAM413 is therefore inhibition of KIAA1655 (Accession XM\_039442). Accordingly, utilities of VGAM413 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1655. Molybdenum Cofactor Synthesis 3 (MOCS3, Accession NM\_014484) is another VGAM413 host target gene. MOCS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MOCS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MOCS3 BINDING SITE, designated SEQ ID:15829, to the nucleotide sequence of VGAM413 RNA, herein designated VGAM RNA, also designated SEQ ID:3124.

[19846] Another function of VGAM413 is therefore inhibition of Molybdenum Cofactor Synthesis 3 (MOCS3, Accession

NM\_014484). Accordingly, utilities of VGAM413 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MOCS3. P66 (Accession NM\_020699) is another VGAM413 host target gene. P66 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P66, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P66 BINDING SITE, designated SEQ ID:21843, to the nucleotide sequence of VGAM413 RNA, herein designated VGAM RNA, also designated SEQ ID:3124.

[19847] Another function of VGAM413 is therefore inhibition of P66 (Accession NM\_020699). Accordingly, utilities of VGAM413 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P66. PRO0529 (Accession NM\_014074) is another VGAM413 host target gene. PRO0529 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO0529, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0529 BINDING SITE,

designated SEQ ID:15301, to the nucleotide sequence of VGAM413 RNA, herein designated VGAM RNA, also designated SEQ ID:3124.

[19848] Another function of VGAM413 is therefore inhibition of PRO0529 (Accession NM\_014074). Accordingly, utilities of VGAM413 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0529. RA-GEF-2 (Accession NM\_016340) is another VGAM413 host target gene. RA-GEF-2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RA-GEF-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RA-GEF-2 BINDING SITE, designated SEQ ID:18465, to the nucleotide sequence of VGAM413 RNA, herein designated VGAM RNA, also designated SEQ ID:3124.

[19849] Another function of VGAM413 is therefore inhibition of RA-GEF-2 (Accession NM\_016340). Accordingly, utilities of VGAM413 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RA-GEF-2. Zinc Finger Protein 17 (HPF3, KOX 10) (ZNF17, Accession XM\_091895) is another VGAM413 host target

gene. ZNF17 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF17 BINDING SITE, designated SEQ ID:40067, to the nucleotide sequence of VGAM413 RNA, herein designated VGAM RNA, also designated SEQ ID:3124.

[19850] Another function of VGAM413 is therefore inhibition of Zinc Finger Protein 17 (HPF3, KOX 10) (ZNF17, Accession XM\_091895). Accordingly, utilities of VGAM413 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF17. LOC128077 (Accession XM\_059208) is another VGAM413 host target gene. LOC128077 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC128077, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC128077 BINDING SITE, designated SEQ ID:36916, to the nucleotide sequence of VGAM413 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3124.

[19851] Another function of VGAM413 is therefore inhibition of LOC128077 (Accession XM\_059208). Accordingly, utilities of VGAM413 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128077. LOC149127 (Accession XM\_097584) is another VGAM413 host target gene. LOC149127 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149127, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149127 BINDING SITE, designated SEQ ID:40949, to the nucleotide sequence of VGAM413 RNA, herein designated VGAM RNA, also designated SEQ ID:3124.

[19852] Another function of VGAM413 is therefore inhibition of LOC149127 (Accession XM\_097584). Accordingly, utilities of VGAM413 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149127. LOC150630 (Accession XM\_097931) is another VGAM413 host target gene. LOC150630 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150630, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150630 BINDING SITE, designated SEQ ID:41239, to the nucleotide sequence of VGAM413 RNA, herein designated VGAM RNA, also designated SEQ ID:3124.

[19853] Another function of VGAM413 is therefore inhibition of LOC150630 (Accession XM\_097931). Accordingly, utilities of VGAM413 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150630. LOC169021 (Accession XM\_095459) is another VGAM413 host target gene. LOC169021 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC169021, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC169021 BINDING SITE, designated SEQ ID:40258, to the nucleotide sequence of VGAM413 RNA, herein designated VGAM RNA, also designated SEQ ID:3124.

[19854] Another function of VGAM413 is therefore inhibition of LOC169021 (Accession XM\_095459). Accordingly, utilities of VGAM413 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC169021. LOC221687 (Accession XM\_166423) is another VGAM413 host target gene. LOC221687 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221687, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221687 BINDING SITE, designated SEQ ID:44306, to the nucleotide sequence of VGAM413 RNA, herein designated VGAM RNA, also designated SEQ ID:3124.

[19855] Another function of VGAM413 is therefore inhibition of LOC221687 (Accession XM\_166423). Accordingly, utilities of VGAM413 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221687. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 414 (VGAM414) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19856] VGAM414 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM414 was detected is described hereinabove with reference to Figs. 1–8.

[19857] VGAM414 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pepper Mottle Virus. VGAM414 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19858] VGAM414 gene encodes a VGAM414 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM414 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM414 precursor RNA is designated SEQ ID:400, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:400 is located at position 8752 relative to the genome of Pepper Mottle Virus.

[19859] VGAM414 precursor RNA folds onto itself, forming VGAM414 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19860] An enzyme complex designated DICER COMPLEX, `dices` the VGAM414 folded precursor RNA into VGAM414 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM414 RNA is designated SEQ ID:3125, and is provided hereinbelow with reference to the sequence listing part.

[19861] VGAM414 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM414 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM414 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19862] VGAM414 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM414 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM414 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM414 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM414 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19863] The complementary binding of VGAM414 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM414 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM414 host target RNA into VGAM414 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19864] It is appreciated that VGAM414 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM414 host target genes. The mRNA of each one of this plurality of VGAM414 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM414 RNA, herein designated VGAM RNA, and which when bound by VGAM414 RNA causes inhibition of translation of respective one or more VGAM414 host target proteins.

[19865] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM414 gene, herein designated VGAM GENE, on one or more VGAM414 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[19866] It is yet further appreciated that a function of VGAM414 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM414 include diagnosis, prevention and treatment of viral infection by Pepper Mottle Virus. Specific functions, and accordingly utilities, of VGAM414 correlate with, and may be deduced from, the identity of the host target genes which VGAM414 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19867] Nucleotide sequences of the VGAM414 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM414 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM414 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM414 are further described hereinbelow with reference to Table 1.

[19868] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM414 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM414 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19869] As mentioned hereinabove with reference to Fig. 1, a function of VGAM414 gene, herein designated VGAM is inhibition of expression of VGAM414 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM414 correlate with, and may be deduced from, the identity of the target genes which VGAM414 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19870] Aldehyde Dehydrogenase 1 Family, Member B1 (ALDH1B1, Accession NM\_000692) is a VGAM414 host target gene. ALDH1B1 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by ALDH1B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALDH1B1 BINDING SITE, designated SEQ ID:6346, to the nucleotide sequence of VGAM414 RNA, herein designated VGAM RNA, also designated SEQ ID:3125.

[19871] A function of VGAM414 is therefore inhibition of Aldehyde Dehydrogenase 1 Family, Member B1 (ALDH1B1, Accession NM\_000692). Accordingly, utilities of VGAM414 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALDH1B1. Cytochrome P450, Subfamily VIIA (cholesterol 7 alpha-monooxygenase), Polypeptide 1 (CYP7A1, Accession NM\_000780) is another VGAM414 host target gene. CYP7A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYP7A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP7A1 BINDING SITE, designated SEQ ID:6421, to the nucleotide sequence of VGAM414 RNA,

herein designated VGAM RNA, also designated SEQ ID:3125.

[19872] Another function of VGAM414 is therefore inhibition of Cytochrome P450, Subfamily VIIA (cholesterol 7 alpha-monooxygenase), Polypeptide 1 (CYP7A1, Accession NM\_000780), a gene which functions in cholesterol and bile acid metabolism . Accordingly, utilities of VGAM414 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP7A1. The function of CYP7A1 has been established by previous studies. In an elegant series of experiments designed to understand the effect of retinoid X receptor (RXR; OMIM Ref. No. 180245) activation on cholesterol balance, Repa et al. (2000) treated animals with the rexinoid LG268. Animals treated with rexinoid exhibited marked changes in cholesterol balance, including inhibition of cholesterol absorption and repressed bile acid synthesis. Studies with receptor-selective agonists revealed that oxysterol receptors (LXRs, OMIM Ref. No. 602423 and 600380) and the bile acid receptor, FXR (OMIM Ref. No. 603826), are the RXR heterodimeric partners that mediate these effects by regulating expression of the reverse-cholesterol transporter, ABC1 (OMIM Ref. No. 600046), and the rate-

limiting enzyme of bile acid synthesis, CYP7A1, respectively. These RXR heterodimers serve as key regulators in cholesterol homeostasis by governing reverse cholesterol transport from peripheral tissues, bile acid synthesis in liver, and cholesterol absorption in intestine. Activation of RXR/LXR heterodimers inhibits cholesterol absorption by upregulation of ABC1 expression in the small intestine. Activation of RXR/FXR heterodimers represses CYP7A1 expression and bile acid production, leading to a failure to solubilize and absorb cholesterol. Studies have shown that RXR/FXR-mediated repression of CYP7A1 is dominant over RXR/LXR-mediated induction of CYP7A1, which explains why the rexinoid represses rather than activates CYP7A1 (Lu et al., 2000). Activation of the LXR signaling pathway results in the upregulation of ABC1 in peripheral cells, including macrophages, to efflux free cholesterol for transport back to the liver through high density lipoprotein, where it is converted to bile acids by the LXR-mediated increase in CYP7A1 expression. Secretion of biliary cholesterol in the presence of increased bile acid pools normally results in enhanced reabsorption of cholesterol; however, with the increased expression of ABC1 and efflux of cholesterol back into the lumen, there

is a reduction in cholesterol absorption and net excretion of cholesterol and bile acid. Rexinoids therefore offer a novel class of agents for treating elevated cholesterol. Agellon et al. (2002) found that wildtype mice and mice transgenic for human CYP7A1 respond differently to cholesterol feeding. Cholesterol feeding stimulated Cyp7a1 mRNA abundance and enzymatic activity in wild-type mice, but repressed human CYP7A1 mRNA and activity in transgenic mice. In transfected hepatoma cells, cholesterol increased mouse Cyp7a1 gene promoter activity, but had no effect on the human CYP7A1 gene promoter. By electrophoretic mobility shift assays, Agellon et al. (2002) found interaction of LXR:RXR with the mouse promoter, but no binding to the human promoter.

[19873] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19874] Lu, T. T.; Makishima, M.; Repa, J. J.; Schoonjans, K.; Kerr, T. A.; Auwerx, J.; Mangelsdorf, D. J. : Molecular basis for feedback regulation of bile acid synthesis by nuclear receptors. *Molec. Cell* 6: 507–515, 2000. ; and

[19875] Agellon, L. B.; Drover, V. A. B.; Cheema, S. K.; Gbaguidi, G. F.; Walsh, A. : Dietary cholesterol fails to stimulate the hu–

man cholesterol 7- $\alpha$ -hydroxylase gene (CYP7A1) in transgeni.

[19876] Further studies establishing the function and utilities of CYP7A1 are found in John Hopkins OMIM database record ID 118455, and in cited publications numbered 12131-12136, 5941, 12137-12140, 594 and 12141 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Engrailed Homolog 2 (EN2, Accession NM\_001427) is another VGAM414 host target gene. EN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EN2 BINDING SITE, designated SEQ ID:7147, to the nucleotide sequence of VGAM414 RNA, herein designated VGAM RNA, also designated SEQ ID:3125.

[19877] Another function of VGAM414 is therefore inhibition of Engrailed Homolog 2 (EN2, Accession NM\_001427), a gene which may be required for normal cerebellar development; a homeobox protein, very strongly similar to murine En2. Accordingly, utilities of VGAM414 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with EN2. The function of EN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM232. Glutamate Dehydrogenase 1 (GLUD1, Accession NM\_005271) is another VGAM414 host target gene. GLUD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GLUD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLUD1 BINDING SITE, designated SEQ ID:11775, to the nucleotide sequence of VGAM414 RNA, herein designated VGAM RNA, also designated SEQ ID:3125.

[19878] Another function of VGAM414 is therefore inhibition of Glutamate Dehydrogenase 1 (GLUD1, Accession NM\_005271). Accordingly, utilities of VGAM414 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLUD1. Outer Dense Fiber of Sperm Tails 2 (ODF2, Accession NM\_002540) is another VGAM414 host target gene. ODF2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region

of mRNA encoded by ODF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ODF2 BINDING SITE, designated SEQ ID:8388, to the nucleotide sequence of VGAM414 RNA, herein designated VGAM RNA, also designated SEQ ID:3125.

[19879] Another function of VGAM414 is therefore inhibition of Outer Dense Fiber of Sperm Tails 2 (ODF2, Accession NM\_002540), a gene which is very strongly similar to rat Odf2 . Accordingly, utilities of VGAM414 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ODF2. The function of ODF2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM363.Single-minded Homolog 2 (Drosophila) (SIM2, Accession NM\_009586) is another VGAM414 host target gene. SIM2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SIM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of SIM2 BINDING SITE, designated SEQ ID:14314, to the nucleotide sequence of VGAM414 RNA, herein designated VGAM RNA, also designated SEQ ID:3125.

[19880] Another function of VGAM414 is therefore inhibition of Single-minded Homolog 2 (Drosophila) (SIM2, Accession NM\_009586), a gene which may be a master gene of cns development. Accordingly, utilities of VGAM414 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIM2. The function of SIM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM369. Zinc Finger Protein 278 (ZNF278, Accession NM\_032050) is another VGAM414 host target gene. ZNF278 BINDING SITE1 through ZNF278 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ZNF278, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF278 BINDING SITE1 through ZNF278 BINDING SITE3, designated SEQ ID:25771, SEQ ID:25780 and SEQ ID:15622 respectively, to the nucleotide sequence of VGAM414 RNA, herein designated VGAM RNA,

also designated SEQ ID:3125.

[19881] Another function of VGAM414 is therefore inhibition of Zinc Finger Protein 278 (ZNF278, Accession NM\_032050), a gene which represses basal transcription as well as RNF4-mediated activation. Accordingly, utilities of VGAM414 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF278. The function of ZNF278 has been established by previous studies. By chromatographic and coimmunoprecipitation analyses, Fedele et al. (2000) showed that ZNF278 interacts with RNF4 both in vitro and in vivo. The authors found that the POZ domain is responsible for repression of basal transcription as well as repression of RNF4-mediated activation. Immunofluorescence analysis demonstrated that ZNF278 colocalizes with RNF4 in the nuclear matrix

[19882] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19883] Fedele, M.; Benvenuto, G.; Pero, R.; Majello, B.; Battista, S.; Lembo, F.; Vollono, E.; Day, P. M.; Santoro, M.; Lania, L.; Bruni, C. B.; Fusco, A.; Chiariotti, L. : A novel member of the BTB/POZ family, PATZ, associates with the RNF4 RING

finger protein and acts as a transcriptional repressor. J. Biol. Chem. 275: 7894–7901, 2000. ; and

[19884] Mastrangelo, T.; Modena, P.; Tornielli, S.; Bullrich, F.; Testi, M. A.; Mezzelani, A.; Radice, P.; Azzarelli, A.; Pilotti, S.; Croce, C. M.; Pierotti, M. A.; Sozzi, G. : A novel zinc finge.

[19885] Further studies establishing the function and utilities of ZNF278 are found in John Hopkins OMIM database record ID 605165, and in sited publications numbered 4395–439 and 3660 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.FLJ20373 (Accession NM\_017792) is another VGAM414 host target gene. FLJ20373 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20373, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20373 BINDING SITE, designated SEQ ID:19426, to the nucleotide sequence of VGAM414 RNA, herein designated VGAM RNA, also designated SEQ ID:3125.

[19886] Another function of VGAM414 is therefore inhibition of FLJ20373 (Accession NM\_017792). Accordingly, utilities of

VGAM414 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20373. Serine Palmitoyltransferase, Long Chain Base Subunit 2 (SPTLC2, Accession NM\_004863) is another VGAM414 host target gene. SPTLC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPTLC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPTLC2 BINDING SITE, designated SEQ ID:11274, to the nucleotide sequence of VGAM414 RNA, herein designated VGAM RNA, also designated SEQ ID:3125.

[19887] Another function of VGAM414 is therefore inhibition of Serine Palmitoyltransferase, Long Chain Base Subunit 2 (SPTLC2, Accession NM\_004863). Accordingly, utilities of VGAM414 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPTLC2. LOC91170 (Accession XM\_036612) is another VGAM414 host target gene. LOC91170 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91170, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91170 BINDING SITE, designated SEQ ID:32481, to the nucleotide sequence of VGAM414 RNA, herein designated VGAM RNA, also designated SEQ ID:3125.

[19888] Another function of VGAM414 is therefore inhibition of LOC91170 (Accession XM\_036612). Accordingly, utilities of VGAM414 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91170. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 415 (VGAM415) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19889] VGAM415 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM415 was detected is described hereinabove with reference to Figs. 1–8.

[19890] VGAM415 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pepper Mottle Virus. VGAM415 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[19891] VGAM415 gene encodes a VGAM415 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM415 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM415 precursor RNA is designated SEQ ID:401, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:401 is located at position 792 relative to the genome of Pepper Mottle Virus.

[19892] VGAM415 precursor RNA folds onto itself, forming VGAM415 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19893] An enzyme complex designated DICER COMPLEX, `dices` the VGAM415 folded precursor RNA into VGAM415 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM415 RNA is designated SEQ ID:3126, and is provided hereinbelow with reference to the sequence listing part.

[19894] VGAM415 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM415 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM415 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19895] VGAM415 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM415 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM415 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM415 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM415 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19896] The complementary binding of VGAM415 RNA, herein designated VGAM RNA, to host target binding sites on VGAM415 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM415 host target RNA into VGAM415 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[19897] It is appreciated that VGAM415 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM415 host target genes. The mRNA of each one of this plurality of VGAM415 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM415 RNA, herein designated VGAM RNA, and which when bound by VGAM415 RNA causes inhibition of translation of respective one or more VGAM415 host target proteins.

[19898] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM415 gene, herein designated VGAM GENE, on one or more VGAM415 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[19899] It is yet further appreciated that a function of VGAM415 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM415 include diagnosis, prevention and treatment of viral infection by Pepper Mottle Virus. Specific functions, and accordingly utilities, of VGAM415 correlate with, and may be deduced from, the identity of the host target genes which VGAM415 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19900] Nucleotide sequences of the VGAM415 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM415 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM415 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM415 are further described hereinbelow with reference to Table 1.

[19901] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM415 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM415 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19902] As mentioned hereinabove with reference to Fig. 1, a function of VGAM415 gene, herein designated VGAM is inhibition of expression of VGAM415 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM415 correlate with, and may be deduced from, the identity of the target genes which VGAM415 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19903] EGF-like-domain, Multiple 4 (EGFL4, Accession XM\_029883) is a VGAM415 host target gene. EGFL4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EGFL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGFL4 BINDING SITE, designated SEQ ID:30962, to the nucleotide sequence of VGAM415 RNA, herein designated

VGAM RNA, also designated SEQ ID:3126.

[19904] A function of VGAM415 is therefore inhibition of EGF-like-domain, Multiple 4 (EGFL4, Accession XM\_029883). Accordingly, utilities of VGAM415 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGFL4. Neuronal Cell Adhesion Molecule (NRCAM, Accession NM\_005010) is another VGAM415 host target gene. NRCAM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NRCAM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRCAM BINDING SITE, designated SEQ ID:11446, to the nucleotide sequence of VGAM415 RNA, herein designated VGAM RNA, also designated SEQ ID:3126.

[19905] Another function of VGAM415 is therefore inhibition of Neuronal Cell Adhesion Molecule (NRCAM, Accession NM\_005010), a gene which functions as a cell surface protein and belongs to the immunoglobulin superfamily. Accordingly, utilities of VGAM415 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRCAM. The function of NRCAM and its

association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM268.ARPP-21 (Accession NM\_016300) is another VGAM415 host target gene. ARPP-21 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARPP-21, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARPP-21 BINDING SITE, designated SEQ ID:18419, to the nucleotide sequence of VGAM415 RNA, herein designated VGAM RNA, also designated SEQ ID:3126.

[19906] Another function of VGAM415 is therefore inhibition of ARPP-21 (Accession NM\_016300). Accordingly, utilities of VGAM415 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARPP-21. UDP-GlcNAc:betaGal Beta-1,3-N-acetylglucosaminyltransferase 7 (B3GNT7, Accession XM\_048735) is another VGAM415 host target gene. B3GNT7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by B3GNT7, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B3GNT7 BINDING SITE, designated SEQ ID:35237, to the nucleotide sequence of VGAM415 RNA, herein designated VGAM RNA, also designated SEQ ID:3126.

[19907] Another function of VGAM415 is therefore inhibition of UDP-GlcNAc:betaGal Beta-1,3-N-acetylglucosaminyltransferase 7 (B3GNT7, Accession XM\_048735). Accordingly, utilities of VGAM415 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GNT7. FLJ11722 (Accession NM\_024970) is another VGAM415 host target gene. FLJ11722 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11722, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11722 BINDING SITE, designated SEQ ID:24519, to the nucleotide sequence of VGAM415 RNA, herein designated VGAM RNA, also designated SEQ ID:3126.

[19908] Another function of VGAM415 is therefore inhibition of

FLJ11722 (Accession NM\_024970). Accordingly, utilities of VGAM415 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11722. FLJ20006 (Accession NM\_017618) is another VGAM415 host target gene. FLJ20006 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20006, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20006 BINDING SITE, designated SEQ ID:19118, to the nucleotide sequence of VGAM415 RNA, herein designated VGAM RNA, also designated SEQ ID:3126.

[19909] Another function of VGAM415 is therefore inhibition of FLJ20006 (Accession NM\_017618). Accordingly, utilities of VGAM415 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20006. FLJ20958 (Accession NM\_022102) is another VGAM415 host target gene. FLJ20958 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20958, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ20958 BINDING SITE, designated SEQ ID:22645, to the nucleotide sequence of VGAM415 RNA, herein designated VGAM RNA, also designated SEQ ID:3126.

[19910] Another function of VGAM415 is therefore inhibition of FLJ20958 (Accession NM\_022102). Accordingly, utilities of VGAM415 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20958. GLTP (Accession NM\_016433) is another VGAM415 host target gene. GLTP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GLTP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLTP BINDING SITE, designated SEQ ID:18554, to the nucleotide sequence of VGAM415 RNA, herein designated VGAM RNA, also designated SEQ ID:3126.

[19911] Another function of VGAM415 is therefore inhibition of GLTP (Accession NM\_016433). Accordingly, utilities of VGAM415 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLTP. KIAA1001 (Accession NM\_014960) is another VGAM415

host target gene. KIAA1001 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1001 BINDING SITE, designated SEQ ID:17323, to the nucleotide sequence of VGAM415 RNA, herein designated VGAM RNA, also designated SEQ ID:3126.

[19912] Another function of VGAM415 is therefore inhibition of KIAA1001 (Accession NM\_014960). Accordingly, utilities of VGAM415 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1001. KIAA1160 (Accession NM\_020701) is another VGAM415 host target gene. KIAA1160 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1160, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1160 BINDING SITE, designated SEQ ID:21850, to the nucleotide sequence of VGAM415 RNA, herein designated VGAM RNA, also designated SEQ ID:3126.

[19913] Another function of VGAM415 is therefore inhibition of KIAA1160 (Accession NM\_020701). Accordingly, utilities of VGAM415 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1160. KIAA1430 (Accession XM\_087593) is another VGAM415 host target gene. KIAA1430 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1430, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1430 BINDING SITE, designated SEQ ID:39356, to the nucleotide sequence of VGAM415 RNA, herein designated VGAM RNA, also designated SEQ ID:3126.

[19914] Another function of VGAM415 is therefore inhibition of KIAA1430 (Accession XM\_087593). Accordingly, utilities of VGAM415 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1430. LRP15 (Accession NM\_052953) is another VGAM415 host target gene. LRP15 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LRP15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRP15 BINDING SITE, designated SEQ ID:27509, to the nucleotide sequence of VGAM415 RNA, herein designated VGAM RNA, also designated SEQ ID:3126.

[19915] Another function of VGAM415 is therefore inhibition of LRP15 (Accession NM\_052953). Accordingly, utilities of VGAM415 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRP15. PTD002 (Accession NM\_016144) is another VGAM415 host target gene. PTD002 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTD002, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTD002 BINDING SITE, designated SEQ ID:18227, to the nucleotide sequence of VGAM415 RNA, herein designated VGAM RNA, also designated SEQ ID:3126.

[19916] Another function of VGAM415 is therefore inhibition of PTD002 (Accession NM\_016144). Accordingly, utilities of VGAM415 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTD002.

LOC120400 (Accession XM\_061971) is another VGAM415 host target gene. LOC120400 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC120400, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120400 BINDING SITE, designated SEQ ID:37219, to the nucleotide sequence of VGAM415 RNA, herein designated VGAM RNA, also designated SEQ ID:3126.

[19917] Another function of VGAM415 is therefore inhibition of LOC120400 (Accession XM\_061971). Accordingly, utilities of VGAM415 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120400. LOC221399 (Accession XM\_168134) is another VGAM415 host target gene. LOC221399 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221399, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221399 BINDING SITE, designated SEQ ID:45047, to the nucleotide sequence of VGAM415 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3126.

[19918] Another function of VGAM415 is therefore inhibition of LOC221399 (Accession XM\_168134). Accordingly, utilities of VGAM415 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221399. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 416 (VGAM416) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19919] VGAM416 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM416 was detected is described hereinabove with reference to Figs. 1–8.

[19920] VGAM416 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pepper Mottle Virus. VGAM416 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19921] VGAM416 gene encodes a VGAM416 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM416 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM416 precursor RNA is designated SEQ ID:402, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:402 is located at position 7262 relative to the genome of Pepper Mottle Virus.

[19922] VGAM416 precursor RNA folds onto itself, forming VGAM416 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19923] An enzyme complex designated DICER COMPLEX, `dices` the VGAM416 folded precursor RNA into VGAM416 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM416 RNA is designated SEQ ID:3127, and is provided hereinbelow with reference to the sequence listing part.

[19924] VGAM416 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM416 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM416 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19925] VGAM416 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM416 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM416 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM416 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM416 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[19926] The complementary binding of VGAM416 RNA, herein designated VGAM RNA, to host target binding sites on VGAM416 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM416 host target RNA into VGAM416 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19927] It is appreciated that VGAM416 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM416 host target genes. The mRNA of

each one of this plurality of VGAM416 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM416 RNA, herein designated VGAM RNA, and which when bound by VGAM416 RNA causes inhibition of translation of respective one or more VGAM416 host target proteins.

[19928] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM416 gene, herein designated VGAM GENE, on one or more VGAM416 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[19929] It is yet further appreciated that a function of VGAM416 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM416 include diagnosis, prevention and treatment of viral infection by Pepper Mottle Virus. Specific functions, and accordingly utilities, of VGAM416 correlate with, and may be deduced from, the identity of the host target genes which VGAM416 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19930] Nucleotide sequences of the VGAM416 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM416 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM416 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM416 are further described hereinbelow with reference to Table 1.

[19931] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM416 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM416 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[19932] As mentioned hereinabove with reference to Fig. 1, a function of VGAM416 gene, herein designated VGAM is inhibition of expression of VGAM416 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM416 correlate with, and may be deduced from, the identity of the target genes which VGAM416 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19933] Filamin B, Beta (actin binding protein 278) (FLNB, Accession XM\_030806) is a VGAM416 host target gene. FLNB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLNB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLNB BINDING SITE, designated SEQ ID:31139, to the nucleotide sequence of VGAM416 RNA, herein designated VGAM RNA, also designated SEQ ID:3127.

[19934] A function of VGAM416 is therefore inhibition of Filamin B, Beta (actin binding protein 278) (FLNB, Accession XM\_030806), a gene which Filamin B, beta; binds actin,

interacts with cytoplasmic domain of Ibalpha. Accordingly, utilities of VGAM416 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLNB. The function of FLNB has been established by previous studies. The platelet Gplb complex (see OMIM Ref. No. 138720) mediates the adherence of platelets at the site of vascular injury through the binding of Gplb-alpha (OMIM Ref. No. 231200) to subendothelial von Willebrand factor (VWF; 193400). In platelets, the Gplb complex is tightly bound to the actin cytoskeleton via an interaction of Gplb-alpha with ABP280 (filamin A; 300017). Using a yeast 2-hybrid screen with the cytoplasmic tail of Gplb-alpha as bait, Takafuta et al. (1998) isolated partial cDNAs encoding a novel filamin homolog that they designated beta-filamin. They used the partial cDNAs to screen a placenta library and recovered additional cDNAs corresponding to the entire beta-filamin coding region. Like ABP280, the predicted 2,602-amino acid protein contains an N-terminal actin-binding domain, a backbone of 24 tandem repeats, and 2 hinge regions. Excluding the unique first hinge region of beta-filamin, the sequences of beta-filamin and ABP280 are 70% identical. Antibodies against beta-filamin detected a 280-kD pro-

tein on Western blots of human umbilical vein endothelial cell (HUVEC) extracts and stained normal human endothelial cells in culture and in situ. Using antigen-capture ELISA, Takafuta et al. (1998) found that beta-filamin associates with Gplb-alpha in both platelets and HUVEC extracts. They determined that the Gplb-alpha-binding domain in beta-filamin is in repeats 17-20, a region that corresponds to the Gplb-alpha-binding domain in ABP280. Northern blot analysis revealed that beta-filamin is expressed as 2 approximately 9.5-kb mRNAs in many adult tissues. The 2 different transcripts appear to result from use of alternative polyadenylation signals. Takafuta et al. (1998) concluded that beta-filamin is a new member of the filamin family that may have significance for Gplb-alpha function in endothelial cells and platelets. Independently, Xu et al. (1998) isolated cDNAs encoding beta-filamin, which they referred to as ABP278. These authors also identified alternatively spliced mRNAs encoding ABP276, a beta-filamin isoform missing the first hinge region. RT-PCR analysis indicated that the 2 isoforms were expressed at different relative levels in various human tissues. The addition of thyroid-stimulating hormone (TSH; OMIM Ref. No. 188530) to cultured thyroid follicular cells

induces rapid and profound disruption of actin microfilaments. Using serum from a Graves disease (OMIM Ref. No. 275000) patient, Leedman et al. (1993) identified a thyroid cDNA encoding TABP (truncated actin-binding protein), a predicted 195-amino acid protein with homology to the C terminus of ABP280. Both Xu et al. (1998) and Takafuta et al. (1998) considered TABP to be a truncated form of beta-filamin. Mutations in the presenilin genes PS1 (OMIM Ref. No. 104311) and PS2 (OMIM Ref. No. 600759) account for approximately 50% of early-onset familial Alzheimer disease (AD; 104300). Zhang et al. (1998) identified beta-filamin as filamin homolog 1 (FH1), a filamin-related protein that interacts with the loop regions of PS1 and PS2. A monoclonal antibody recognizing both ABP280 and FH1 bound to blood vessels and astrocytes in the normal brain. In the brains of AD patients, Zhang et al. (1998) observed staining also in neurofibrillary tangles, neuropil threads, and dystrophic neurites within some senile plaques. The authors stated that detection of these presenilin-interacting proteins in these brain structures suggests that ABP280 and FH1 may be involved in the development of AD and that interactions between presenilins and ABP280/FH1 may be functionally significant. Takafuta

et al. (1998) noted that the FH1 sequence is identical to the C-terminal 291 amino acids of beta-filamin except for 2 residues, making it very likely that FH1 represents the C-terminal region of beta-filamin. By analysis of somatic cell hybrids, Zhang et al. (1998) mapped the FH1 gene to chromosome 3. Takafuta et al. (1998) refined the map position to 3p21.1-p14.3 based on inclusion of a previously mapped STS within the beta-filamin sequence. By FISH, Brocker et al. (1999) assigned the FLNB gene to 3p14.3. Chakarova et al. (2000) mapped FLNB to 3p14 by radiation hybrid analysis.

[19935] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19936] Brocker, F.; Bardenheuer, W.; Vieten, L.; Julicher, K.; Werner, N.; Marquitan, G.; Michael, D.; Opalka, B.; Schutte, J. : Assignment of human filamin gene FLNB to human chromosome band 3p14.3 and identification of YACs containing the complete FLNB transcribed region. Cytogenet. Cell Genet. 85: 267-268, 1999. ; and

[19937] Chakarova, C.; Wehnert, M. S.; Uhl, K.; Sakthivel, S.; Vosberg, H.-P.; van der Ven, P. F. M.; Furst, D. O. : Genomic structure and fine mapping of the two human filamin gene

paralogues.

[19938] Further studies establishing the function and utilities of FLNB are found in John Hopkins OMIM database record ID 603381, and in cited publications numbered 7501, 750 and 5281–5282 listed in the bibliography section herein–below, which are also hereby incorporated by reference. LOC143310 (Accession XM\_084485) is another VGAM416 host target gene. LOC143310 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC143310, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143310 BINDING SITE, designated SEQ ID:37606, to the nucleotide sequence of VGAM416 RNA, herein designated VGAM RNA, also designated SEQ ID:3127.

[19939] Another function of VGAM416 is therefore inhibition of LOC143310 (Accession XM\_084485). Accordingly, utilities of VGAM416 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143310. LOC92719 (Accession XM\_046853) is another VGAM416 host target gene. LOC92719 BINDING SITE is HOST TARGET binding site found in the 3` un–

translated region of mRNA encoded by LOC92719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92719 BINDING SITE, designated SEQ ID:34847, to the nucleotide sequence of VGAM416 RNA, herein designated VGAM RNA, also designated SEQ ID:3127.

[19940] Another function of VGAM416 is therefore inhibition of LOC92719 (Accession XM\_046853). Accordingly, utilities of VGAM416 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92719. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 417 (VGAM417) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19941] VGAM417 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM417 was detected is described hereinabove with reference to Figs. 1–8.

[19942] VGAM417 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Pepper Mottle Virus. VGAM417 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19943] VGAM417 gene encodes a VGAM417 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM417 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM417 precursor RNA is designated SEQ ID:403, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:403 is located at position 8444 relative to the genome of Pepper Mottle Virus.

[19944] VGAM417 precursor RNA folds onto itself, forming VGAM417 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19945] An enzyme complex designated DICER COMPLEX, `dices` the VGAM417 folded precursor RNA into VGAM417 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM417 RNA is designated SEQ ID:3128, and is provided hereinbelow with reference to the sequence listing part.

[19946] VGAM417 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM417 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM417 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19947] VGAM417 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM417 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM417 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM417 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM417 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19948] The complementary binding of VGAM417 RNA, herein designated VGAM RNA, to host target binding sites on VGAM417 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM417 host tar-

get RNA into VGAM417 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19949] It is appreciated that VGAM417 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM417 host target genes. The mRNA of each one of this plurality of VGAM417 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM417 RNA, herein designated VGAM RNA, and which when bound by VGAM417 RNA causes inhibition of translation of respective one or more VGAM417 host target proteins.

[19950] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM417 gene, herein designated VGAM GENE, on one or more VGAM417 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[19951] It is yet further appreciated that a function of VGAM417 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM417 include diagnosis, prevention and treatment of viral infection by Pepper Mottle Virus. Specific functions, and accordingly utilities, of VGAM417 correlate with, and may be deduced from, the identity of the host target genes which VGAM417 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19952] Nucleotide sequences of the VGAM417 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM417 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM417 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM417 are further

described hereinbelow with reference to Table 1.

[19953] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM417 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM417 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19954] As mentioned hereinabove with reference to Fig. 1, a function of VGAM417 gene, herein designated VGAM is inhibition of expression of VGAM417 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM417 correlate with, and may be deduced from, the identity of the target genes which VGAM417 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19955] Calpain 10 (CAPN10, Accession NM\_023089) is a VGAM417 host target gene. CAPN10 BINDING SITE1 and CAPN10 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CAPN10, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of CAPN10 BINDING SITE1 and CAPN10 BINDING SITE2, designated SEQ ID:23358 and SEQ ID:23357 respectively, to the nucleotide sequence of VGAM417 RNA, herein designated VGAM RNA, also designated SEQ ID:3128.

[19956] A function of VGAM417 is therefore inhibition of Calpain 10 (CAPN10, Accession NM\_023089), a gene which catalyzes limited proteolysis of substrates involved in cytoskeletal remodelling and signal transduction. Accordingly, utilities of VGAM417 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN10. The function of CAPN10 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM247. RAB11A, Member RAS Oncogene Family (RAB11A, Accession NM\_004663) is another VGAM417 host target gene. RAB11A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB11A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB11A BINDING SITE, designated SEQ ID:11033, to the nucleotide

sequence of VGAM417 RNA, herein designated VGAM RNA, also designated SEQ ID:3128.

[19957] Another function of VGAM417 is therefore inhibition of RAB11A, Member RAS Oncogene Family (RAB11A, Accession NM\_004663). Accordingly, utilities of VGAM417 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB11A. DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 28 (DDX28, Accession NM\_018380) is another VGAM417 host target gene. DDX28 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DDX28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX28 BINDING SITE, designated SEQ ID:20407, to the nucleotide sequence of VGAM417 RNA, herein designated VGAM RNA, also designated SEQ ID:3128.

[19958] Another function of VGAM417 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 28 (DDX28, Accession NM\_018380). Accordingly, utilities of VGAM417 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX28.

FLJ11608 (Accession NM\_024557) is another VGAM417 host target gene. FLJ11608 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11608, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11608 BINDING SITE, designated SEQ ID:23775, to the nucleotide sequence of VGAM417 RNA, herein designated VGAM RNA, also designated SEQ ID:3128.

[19959] Another function of VGAM417 is therefore inhibition of FLJ11608 (Accession NM\_024557). Accordingly, utilities of VGAM417 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11608. HGC6.1.1 (Accession NM\_014354) is another VGAM417 host target gene. HGC6.1.1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HGC6.1.1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HGC6.1.1 BINDING SITE, designated SEQ ID:15683, to the nucleotide sequence of VGAM417 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3128.

[19960] Another function of VGAM417 is therefore inhibition of HGC6.1.1 (Accession NM\_014354). Accordingly, utilities of VGAM417 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HGC6.1.1. KIAA0417 (Accession XM\_048898) is another VGAM417 host target gene. KIAA0417 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0417, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0417 BINDING SITE, designated SEQ ID:35293, to the nucleotide sequence of VGAM417 RNA, herein designated VGAM RNA, also designated SEQ ID:3128.

[19961] Another function of VGAM417 is therefore inhibition of KIAA0417 (Accession XM\_048898). Accordingly, utilities of VGAM417 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0417. KIAA0766 (Accession NM\_014805) is another VGAM417 host target gene. KIAA0766 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0766, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0766 BINDING SITE, designated SEQ ID:16742, to the nucleotide sequence of VGAM417 RNA, herein designated VGAM RNA, also designated SEQ ID:3128.

[19962] Another function of VGAM417 is therefore inhibition of KIAA0766 (Accession NM\_014805). Accordingly, utilities of VGAM417 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0766. LOC146733 (Accession XM\_097076) is another VGAM417 host target gene. LOC146733 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146733, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146733 BINDING SITE, designated SEQ ID:40726, to the nucleotide sequence of VGAM417 RNA, herein designated VGAM RNA, also designated SEQ ID:3128.

[19963] Another function of VGAM417 is therefore inhibition of LOC146733 (Accession XM\_097076). Accordingly, utilities of VGAM417 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC146733. LOC254431 (Accession XM\_173024) is another VGAM417 host target gene. LOC254431 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254431, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254431 BINDING SITE, designated SEQ ID:46289, to the nucleotide sequence of VGAM417 RNA, herein designated VGAM RNA, also designated SEQ ID:3128.

[19964] Another function of VGAM417 is therefore inhibition of LOC254431 (Accession XM\_173024). Accordingly, utilities of VGAM417 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254431. LOC92539 (Accession XM\_045632) is another VGAM417 host target gene. LOC92539 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC92539, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92539 BINDING SITE, designated SEQ ID:34498, to the

nucleotide sequence of VGAM417 RNA, herein designated VGAM RNA, also designated SEQ ID:3128.

[19965] Another function of VGAM417 is therefore inhibition of LOC92539 (Accession XM\_045632). Accordingly, utilities of VGAM417 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92539. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 418 (VGAM418) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19966] VGAM418 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM418 was detected is described hereinabove with reference to Figs. 1–8.

[19967] VGAM418 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pepper Mottle Virus. VGAM418 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19968] VGAM418 gene encodes a VGAM418 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM418 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM418 precursor RNA is designated SEQ ID:404, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:404 is located at position 4033 relative to the genome of Pepper Mottle Virus.

[19969] VGAM418 precursor RNA folds onto itself, forming VGAM418 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19970] An enzyme complex designated DICER COMPLEX, `dices` the VGAM418 folded precursor RNA into VGAM418 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM418 RNA is designated SEQ ID:3129, and is provided hereinbelow with reference to the sequence listing part.

[19971] VGAM418 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM418 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM418 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19972] VGAM418 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM418 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM418 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM418 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM418 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19973] The complementary binding of VGAM418 RNA, herein designated VGAM RNA, to host target binding sites on VGAM418 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM418 host target RNA into VGAM418 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19974] It is appreciated that VGAM418 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM418 host target genes. The mRNA of each one of this plurality of VGAM418 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM418 RNA, herein designated VGAM RNA, and which when bound by VGAM418 RNA causes inhibition of translation of respective one or more VGAM418 host target proteins.

[19975] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM418 gene, herein designated VGAM GENE, on one or more VGAM418 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[19976] It is yet further appreciated that a function of VGAM418 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM418 include diagnosis, prevention and treatment of viral infection by Pepper Mottle Virus. Specific functions, and accordingly utilities, of VGAM418 correlate with, and may be deduced from, the identity of the host target genes which VGAM418 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[19977] Nucleotide sequences of the VGAM418 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM418 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM418 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM418 are further described hereinbelow with reference to Table 1.

[19978] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM418 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM418 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[19979] As mentioned hereinabove with reference to Fig. 1, a function of VGAM418 gene, herein designated VGAM is inhibition of expression of VGAM418 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM418 correlate with, and may be deduced from, the identity of the target genes which VGAM418 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[19980] Lymphocyte Cytosolic Protein 1 (L-plastin) (LCP1, Accession NM\_002298) is a VGAM418 host target gene. LCP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LCP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LCP1 BINDING SITE, designated SEQ ID:8082, to the nucleotide sequence of VGAM418 RNA, herein designated VGAM RNA, also designated SEQ ID:3129.

[19981] A function of VGAM418 is therefore inhibition of Lymphocyte Cytosolic Protein 1 (L-plastin) (LCP1, Accession

NM\_002298), a gene which is involved in t cell antigen receptor mediated signaling. Accordingly, utilities of VGAM418 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LCP1. The function of LCP1 has been established by previous studies. Hamaguchi et al. (1982) described a genetic polymorphism of a major human lymphocyte cytosolic protein (LCP) of molecular weight 64,000, detected in PHA-stimulated peripheral blood lymphocytes by high-resolution 2-dimensional electrophoresis (O'Farrell, 1975; Klose, 1975). Three different phenotypes determined by 2 common alleles at a single locus were found. In Japanese, the frequency of the 2 alleles was 0.936 and 0.064, respectively. The polypeptide was not detected in HeLa cells, fibroblasts, red cells, serum, or cerebrum. Traces were found in liver, kidney and skeletal muscle. (Hamaguchi et al. (1982) demonstrated polymorphism in 3 others of about 100 polypeptides. The 4 were all cytosolic and since they were separated by isoelectric focusing, they are all charge variants. The molecular weights of the 3 other polymorphic lymphocyte cytosol polypeptides were 40, 49, and 100 kD; see 174880. This stands in contrast to the restricted genetic variability in fibroblast polypeptides

(Walton et al., 1979; McConkey et al., 1979; Giometti and Anderson, 1981).) Data on gene frequencies of allelic variants were tabulated by Roychoudhury and Nei (1988). Kondo et al. (1985) assigned the LCP1 gene to 13q14.1–q14.2 by the deletion/dosage method. They studied a patient with trisomy 13 who had 1.5 times the normal amount of protein, a patient with retinoblastoma and deletion of 13q12.3–q21.2 who had half the normal amount of protein, and a patient with retinoblastoma and deletion of 13q14.1–q31.2 who had lost the father's allele and had half the normal amount of protein (Kondo et al., 1985). Close linkage to ESD (OMIM Ref. No. 133280) was indicated by a maximum lod score of 4.221 at zero recombination. As part of an undertaking to map by genetic linkage human lymphocyte proteins that are genetically polymorphic in isoelectric point, Goldman et al. (1991) mapped the LCP1 gene to a site near the ESD locus on chromosome 13 by studies in 9 families from the CEPH collection. The proteins in the immortalized lymphocyte cell lines were analyzed by 2-dimensional electrophoresis. Murayama et al. (1993) demonstrated that L-plastin and LCP1 are identical and mapped the gene to 13q14.3. Lin et al. (1988) isolated partial cDNAs encoding L-plastin

and T-plastin (OMIM Ref. No. 300131) from a transformed human fibroblast cDNA library. Northern blot analysis revealed that L-plastin is expressed as a 3.7-kb mRNA in leukocytes, transformed fibroblasts, and a diverse array of human tumor cell lines. Zu et al. (1990) reported that L-plastin is identical to p65, an interleukin-2 (IL2; 147680)-stimulated phosphoprotein found in human T cells. Zu et al. (1990) isolated p65 cDNAs from a human T-lymphocyte cDNA library. The predicted 627-amino acid p65 protein contains 2 EF-hand calcium-binding domains, a calmodulin-binding site, and 2 tandem repeats of an actin-binding domain. Lin et al. (1993) reported that both the L-plastin and T-plastin genes contain 16 exons and span approximately 90 kb. Lin et al. (1997) found that the human and murine L-plastin promoters are highly homologous and function equally well in either human or murine leukocytes. The LAZ3 gene (BCL6; 109565) on 3q27 is nonrandomly disrupted in B-cell non-Hodgkin lymphoma by chromosomal translocations. Galiegue-Zouitina et al. (1999) identified the L-plastin gene as a novel LAZ3 partner in chimeric transcripts resulting from a t(3;13)(q27;q14) translocation in 2 cases of B-cell lymphoma. As a consequence of the translocation, the

5-prime regulatory region of each gene was exchanged, creating both LCP1-LAZ3 and reciprocal LAZ3-LCP1 fusion transcripts in one case, and only an LCP1-LAZ3 fusion transcript in the other.

[19982] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[19983] Galiegue-Zouitina, S.; Quief, S.; Hildebrand, M.-P.; Denis, C.; Detourmignies, L.; Lai, J.-L.; Kerckaert, J.-P. : Nonrandom fusion of L-plastin (LCP1) and LAZ3 (BCL6) genes by t(3;13)(q27;q14) chromosome translocation in two cases of B-cell non-Hodgkin lymphoma. *Genes Chromosomes Cancer* 26: 97-105, 1999. ; and

[19984] Lin, C.-S.; Park, T.; Chen, Z. P.; Leavitt, J. : Human plastin genes: comparative gene structure, chromosome location, and differential expression in normal and neoplastic cells. *J. Bi.*

[19985] Further studies establishing the function and utilities of LCP1 are found in John Hopkins OMIM database record ID 153430, and in cited publications numbered 607-608, 3850-616, 652-658, 1165 and 3780-662 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. SON DNA Binding Protein (SON,

Accession NM\_058183) is another VGAM418 host target gene. SON BINDING SITE1 and SON BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SON, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SON BINDING SITE1 and SON BINDING SITE2, designated SEQ ID:27745 and SEQ ID:29041 respectively, to the nucleotide sequence of VGAM418 RNA, herein designated VGAM RNA, also designated SEQ ID:3129.

[19986] Another function of VGAM418 is therefore inhibition of SON DNA Binding Protein (SON, Accession NM\_058183). Accordingly, utilities of VGAM418 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SON. SH3 Domain Binding Glutamic Acid-rich Protein Like 2 (SH3BGRL2, Accession NM\_031469) is another VGAM418 host target gene. SH3BGRL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SH3BGRL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

SH3BGRL2 BINDING SITE, designated SEQ ID:25531, to the nucleotide sequence of VGAM418 RNA, herein designated VGAM RNA, also designated SEQ ID:3129.

[19987] Another function of VGAM418 is therefore inhibition of SH3 Domain Binding Glutamic Acid-rich Protein Like 2 (SH3BGRL2, Accession NM\_031469). Accordingly, utilities of VGAM418 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BGRL2. LOC138389 (Accession XM\_072534) is another VGAM418 host target gene. LOC138389 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC138389, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC138389 BINDING SITE, designated SEQ ID:37504, to the nucleotide sequence of VGAM418 RNA, herein designated VGAM RNA, also designated SEQ ID:3129.

[19988] Another function of VGAM418 is therefore inhibition of LOC138389 (Accession XM\_072534). Accordingly, utilities of VGAM418 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC138389. LOC90246 (Accession XM\_030283) is an—

other VGAM418 host target gene. LOC90246 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90246, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90246 BINDING SITE, designated SEQ ID:30999, to the nucleotide sequence of VGAM418 RNA, herein designated VGAM RNA, also designated SEQ ID:3129.

[19989] Another function of VGAM418 is therefore inhibition of LOC90246 (Accession XM\_030283). Accordingly, utilities of VGAM418 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90246. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 419 (VGAM419) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[19990] VGAM419 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM419 was detected is described

hereinabove with reference to Figs. 1–8.

[19991] VGAM419 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Pepper Mottle Virus.

VGAM419 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[19992] VGAM419 gene encodes a VGAM419 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM419 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM419 precursor RNA is designated SEQ ID:405, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:405 is located at position 6952 relative to the genome of Pepper Mottle Virus.

[19993] VGAM419 precursor RNA folds onto itself, forming VGAM419 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[19994] An enzyme complex designated DICER COMPLEX, `dices` the VGAM419 folded precursor RNA into VGAM419 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 54%) nucleotide sequence of VGAM419 RNA is designated SEQ ID:3130, and is provided hereinbelow with reference to the sequence listing part.

[19995] VGAM419 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM419 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM419 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[19996] VGAM419 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM419 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM419 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM419 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM419 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[19997] The complementary binding of VGAM419 RNA, herein designated VGAM RNA, to host target binding sites on VGAM419 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM419 host target RNA into VGAM419 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[19998] It is appreciated that VGAM419 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM419 host target genes. The mRNA of each one of this plurality of VGAM419 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM419 RNA, herein designated VGAM RNA, and which when bound by VGAM419 RNA causes inhibition of translation of respective one or more VGAM419 host target proteins.

[19999] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM419 gene, herein designated VGAM GENE, on one or more VGAM419 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[20000] It is yet further appreciated that a function of VGAM419 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of viral infection by Pepper Mottle Virus. Specific functions, and accordingly utilities, of VGAM419 correlate with, and may be deduced from, the identity of the host target genes which VGAM419 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20001] Nucleotide sequences of the VGAM419 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM419 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM419 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM419 are further described hereinbelow with reference to Table 1.

[20002] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM419 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM419 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20003] As mentioned hereinabove with reference to Fig. 1, a function of VGAM419 gene, herein designated VGAM is inhibition of expression of VGAM419 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM419 correlate with, and may be deduced from, the identity of the target genes which VGAM419 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20004] AXL Receptor Tyrosine Kinase (AXL, Accession NM\_021913) is a VGAM419 host target gene. AXL BINDING SITE1 and AXL BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AXL, corresponding to HOST TARGET binding sites

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AXL BINDING SITE1 and AXL BINDING SITE2, designated SEQ ID:22442 and SEQ ID:7421 respectively, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20005] A function of VGAM419 is therefore inhibition of AXL Receptor Tyrosine Kinase (AXL, Accession NM\_021913). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AXL. Betaine-homocysteine Methyltransferase 2 (BHMT2, Accession NM\_017614) is another VGAM419 host target gene. BHMT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BHMT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BHMT2 BINDING SITE, designated SEQ ID:19117, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20006] Another function of VGAM419 is therefore inhibition of Betaine-homocysteine Methyltransferase 2 (BHMT2, Ac-

cession NM\_017614). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BHMT2. Carbohydrate Kinase-like (CARKL, Accession NM\_013276) is another VGAM419 host target gene. CARKL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CARKL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CARKL BINDING SITE, designated SEQ ID:14940, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20007] Another function of VGAM419 is therefore inhibition of Carbohydrate Kinase-like (CARKL, Accession NM\_013276), a gene which is a putative carbohydrate kinase and may be a modifier for the cystinosis phenotype. Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CARKL. The function of CARKL has been established by previous studies. Touchman et al. (2000) sequenced 200 kb surrounding the gene encoding cystinosis (CTNS; 606272), which is mutated in nephropathic cystinosis

(OMIM Ref. No. 219800), on chromosome 17p13. They found that genomic sequence in this region matched known ESTs. Using PCR primers to amplify a human fetal kidney cDNA library, the authors cloned a cDNA, which they designated CARKL (carbohydrate kinase-like), encoding a deduced 478-amino acid protein. The CARKL protein contains motifs showing weak similarity to 2 domains of the FGGY family of carbohydrate kinases. It does not appear to contain a signal sequence, suggesting that it is localized in the cytoplasm. Northern blot analysis detected expression of a 3.9-kb CARKL transcript predominantly in liver, kidney, and pancreas, with weaker expression in heart, placenta, brain, and lung. Additionally, a 2.7-kb transcript was detected in liver and, to a lesser extent, in heart. By sequence analysis, Touchman et al. (2000) determined that the CARKL gene maps within the telomeric end of a 57-kb segment on 17p13 that is commonly deleted in cystinosis. They hypothesized that CARKL may be a modifier for the cystinosis phenotype.

[20008] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20009] Touchman, J. W.; Anikster, Y.; Dietrich, N. L.; Braden

Maduro, V. V.; McDowell, G.; Shotelersuk, V.; Bouffard, G. G.; Beckstrom-Sternberg, S. M.; Gahl, W. A.; Green, E. D. : The genomic region encompassing the nephropathic cystinosis gene (CTNS): complete sequencing of a 200-kb segment and discovery of a novel gene within the common cystinosis-causing deletion. *Genome Res.* 10: 165–173, 2000. ; and

[20010] Phornphutkul, C.; Anikster, Y.; Huizing, M.; Braun, P.; Brodie, C.; Chou, J. Y.; Gahl, W. A. : The promoter of a lysosomal membrane transporter gene, CTNS, binds Sp-1, shares sequences.

[20011] Further studies establishing the function and utilities of CARKL are found in John Hopkins OMIM database record ID 605060, and in cited publications numbered 503 and 9434 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Glutaminase (GLS, Accession NM\_014905) is another VGAM419 host target gene. GLS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GLS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GLS BINDING SITE, designated SEQ ID:17112,

to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20012] Another function of VGAM419 is therefore inhibition of Glutaminase (GLS, Accession NM\_014905). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GLS. Potassium Voltage-gated Channel, Delayed-rectifier, Subfamily S, Member 2 (KCNS2, Accession XM\_043106) is another VGAM419 host target gene. KCNS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNS2 BINDING SITE, designated SEQ ID:33896, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20013] Another function of VGAM419 is therefore inhibition of Potassium Voltage-gated Channel, Delayed-rectifier, Subfamily S, Member 2 (KCNS2, Accession XM\_043106), a gene which mediates the voltage-dependent potassium ion permeability of excitable membranes. Accordingly,

utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNS2. The function of KCNS2 has been established by previous studies. See KCNS1 (OMIM Ref. No. 602905). By searching an expressed sequence tag (EST) database with the peptide sequence of the silent Kv8.1 alpha subunit, Salinas et al. (1997) identified human cDNAs encoding KCNS2, which they called Kv9.2. Using these ESTs, the authors isolated a mouse Kcns2 cDNA from a brain cDNA library. The predicted 477-amino acid Kcns2 protein has all of the structural characteristics of an outward rectifier Kv alpha subunit, namely 6 transmembrane domains, a transmembrane region with 5 positively charged amino acids, and a conserved pore-forming region. Several putative phosphorylation sites are located in the cytoplasmic regions. Northern blot analysis showed that Kcns2 is expressed only in the brain. In situ hybridization detected high levels of Kcns2 mRNA in the olfactory bulb, cerebral cortex, hippocampal formation, habenula, basolateral amygdaloid nuclei, and cerebellum; expression was also found in the retina and spinal cord. Salinas et al. (1997) demonstrated that Kcns2 does not have potassium channel activity by itself but can modulate the activities of the

Kv2.1 (see OMIM Ref. No. KCNB1; 600397) and Kv2.2 alpha subunits. By fluorescence in situ hybridization and radiation hybrid mapping, Banfi et al. (1996) mapped an EST (GenBank R19352) corresponding to the human KCNS2 gene (Salinas et al., 1997) to 8q22.

[20014] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20015] Banfi, S.; Borsani, G.; Rossi, E.; Bernard, L.; Guffanti, A.; Rubboli, F.; Marchitello, A.; Giglio, S.; Coluccia, E.; Zollo, M.; Zuffardi, O.; Ballabio, A. : Identification and mapping of human cDNAs homologous to Drosophila mutant genes through EST database searching. Nature Genet. 13: 167-174, 1996. ; and

[20016] Salinas, M.; Duprat, F.; Heurteaux, C.; Hugnot, J.-P.; Lazdunski, M. : New modulatory alpha subunits for mammalian Shab K(+) channels. J. Biol. Chem. 272: 24371-24379, 1997.

[20017] Further studies establishing the function and utilities of KCNS2 are found in John Hopkins OMIM database record ID 602906, and in cited publications numbered 6021 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Moesin (MSN, Ac-

cession XM\_013042) is another VGAM419 host target gene. MSN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MSN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSN BINDING SITE, designated SEQ ID:30230, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20018] Another function of VGAM419 is therefore inhibition of Moesin (MSN, Accession XM\_013042), a gene which may have a role linking the cytoskeleton to the plasma membrane. Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSN. The function of MSN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM248. Neural Retina Leucine Zipper (NRL, Accession NM\_006177) is another VGAM419 host target gene. NRL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NRL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRL BINDING SITE, designated SEQ ID:12839, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20019] Another function of VGAM419 is therefore inhibition of Neural Retina Leucine Zipper (NRL, Accession NM\_006177), a gene which has a basic motif and a leucine zipper domain similar to jun and fos. Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRL. The function of NRL has been established by previous studies. Farjo et al. (1997) determined the complete sequence of the human NRL gene, identified a polymorphic (CA)<sub>n</sub> repeat (identical to D14S64) within an NRL-containing cosmid, and refined the location of the NRL gene by linkage analysis. Since a locus for autosomal recessive retinitis pigmentosa was thought to map to 14q11 in Sardinian families (Wright et al., 1995), and because mutations in rhodopsin (OMIM Ref. No. 180380), a gene regulated by the NRL protein, cause RP, NRL was considered a valid candidate gene for retinopathies. In a panel of patients representing independent families with inherited

retinal degeneration, Farjo et al. (1997) sequenced genomic PCR products of the NRL gene and of the rhodopsin–NRL response element. No causative mutations were identified. Animal model experiments lend further support to the function of NRL. Mears et al. (2001) generated mice with deletion of the NRL gene. *Nrl*  $-/-$  mice had complete loss of rod function and supernormal cone function, mediated by S cones. The photoreceptors in the *Nrl*  $-/-$  retina had cone-like nuclear morphology and short, sparse outer segments with abnormal disks. Analysis of retinal gene expression confirmed the apparent functional transformation of rods into S cones in the *Nrl*  $-/-$  retina. Mears et al. (2001) suggested that NRL acts as a molecular switch during rod–cell development by directly modulating rod-specific genes while simultaneously inhibiting the S-cone pathway through the activation of NR2E3 (OMIM Ref. No. 604485).

[20020] It is appreciated that the abovementioned animal model for NRL is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[20021] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [20022] Farjo, Q.; Jackson, A.; Pieke-Dahl, S.; Scott, K.; Kimberling, W. J.; Sieving, P. A.; Richards, J. E.; Swaroop, A. : Human bZIP transcription factor gene NRL: structure, genomic sequence, and fine linkage mapping at 14q11.2 and negative mutation analysis in patients with retinal degeneration. *Genomics* 45: 395–401, 1997. ; and
- [20023] Mears, A. J.; Kondo, M.; Swain, P. K.; Takada, Y.; Bush, R. A.; Saunders, T. L.; Sieving, P. A.; Swaroop, A. : Nrl is required for rod photoreceptor development. *Nature Genet.* 29: 447–45.
- [20024] Further studies establishing the function and utilities of NRL are found in John Hopkins OMIM database record ID 162080, and in cited publications numbered 12720–12730 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Phosphorylase Kinase, Beta (PHKB, Accession NM\_000293) is another VGAM419 host target gene. PHKB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PHKB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

PHKB BINDING SITE, designated SEQ ID:5838, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20025] Another function of VGAM419 is therefore inhibition of Phosphorylase Kinase, Beta (PHKB, Accession NM\_000293). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHKB. RAN Binding Protein 9 (RANBP9, Accession NM\_005493) is another VGAM419 host target gene. RANBP9 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RANBP9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RANBP9 BINDING SITE, designated SEQ ID:11996, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20026] Another function of VGAM419 is therefore inhibition of RAN Binding Protein 9 (RANBP9, Accession NM\_005493), a gene which is involved in microtubule nucleation. Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associ-

ated with RANBP9. The function of RANBP9 has been established by previous studies. With the 2-hybrid method using human RAN (OMIM Ref. No. 601179) as bait, Nakamura et al. (1998) isolated a novel human protein with a molecular mass of 55 kD, which they called RANBPM. The cDNA is 2.8 kb in length and encodes a protein of 500 amino acid residues. Mouse, hamster, and human RANBPM are identical. The C-terminal half of the *S. cerevisiae* gene YGL227w is 30% identical to RANBPM. Immunoblotting analysis using antibodies against RANBPM revealed that RANBPM was localized within the centrosome throughout the cell cycle. Overexpression of RANBPM produced multiple spots which were colocalized with gamma-tubulin (OMIM Ref. No. 191135) and acted as ectopic microtubule nucleation sites, resulting in a reorganization of the microtubule network. RANBPM cosedimented with centrosomal fractions by sucrose-density gradient centrifugation. Microtubule aster formation was inhibited by both anti-RANBPM antibodies and nonhydrolyzable RAN-GTP (see OMIM Ref. No. 602362). RANBPM specifically interacted with RAN-GTP in a 2-hybrid assay. RANBPM is localized within the central part of microtubule asters. Nakamura et al. (1998)

demonstrated that RANBPM is involved in microtubule nucleation, and suggested that RAN regulates the centrosome through RANBPM. Nishitani et al. (2001) determined that the 55-kD RANBP9 is a truncated protein. They cloned the full-length RANBP9 cDNA by PCR from a HeLa cell library and found that it encodes a deduced 729-amino acid protein with a calculated molecular mass of 79 kD. RANBP9 contains long stretches of proline within the N terminus, and a glutamine stretch following the first proline stretch. Human and mouse RANBP9 share greater than 96% sequence identity. Western blot analysis of transfected cells revealed a protein with an apparent molecular mass of 90 kD. Unlike the truncated protein, the full-length protein does not show localization within centrosomes, but localizes within the perinuclear region or the nucleus. In mitotic COS-7 cells transfected with RANBP9, fluorescence was observed throughout the cell.

tein, RanBPM, causes ectopic microtubule nucleation similar to gamma-tubulin. J. Cell Biol. 143: 1041–1052, 1998.  
; and

[20029] Nishitani, H.; Hirose, E.; Uchimura, Y.; Nakamura, M.; Umeda, M.; Nishii, K.; Mori, N.; Nishimoto, T. : Full-sized RanBPM cDNA encodes a protein possessing a long stretch of proline and.

[20030] Further studies establishing the function and utilities of RANBP9 are found in John Hopkins OMIM database record ID 603854, and in cited publications numbered 7420–7421 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. SMG1 (Accession NM\_015092) is another VGAM419 host target gene. SMG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SMG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMG1 BINDING SITE, designated SEQ ID:17481, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20031] Another function of VGAM419 is therefore inhibition of SMG1 (Accession NM\_015092), a gene which acts as the

target for the cell-cycle arrest and immunosuppressive effects. Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMG1. The function of SMG1 has been established by previous studies. Denning et al. (2001) found that immunoprecipitates of human kidney cells transfected with wildtype SMG1 were active in autophosphorylation assays and in assays using a general phospho-acceptor as substrate. SMG1 also exhibited a strong preference for  $Mn^{2+}$  over  $Mg^{2+}$  and was inhibited by nanomolar concentrations of wortmannin, similar to findings for other PIK-related kinases. It was not inhibited by rapamycin despite the presence of a putative rapamycin-binding domain. Yamashita et al. (2001) found that both the 400-kD and 430-kD SMG1 proteins immunoprecipitated from HeLa cell lysates were capable of autophosphorylation. By mutation analysis, they determined that asp2331 is required for the intrinsic autophosphorylation activity. They also found that overexpression of SMG1, but not of a kinase-inactive point mutant, caused phosphorylation of specific serine residues in the C-terminal SQ motifs of UPF1/SMG2 (RENT1; 601430), a member of the mRNA surveillance complex. Using coex-

pression and immunoprecipitation assays, they determined that SMG1 associates with other components of the mRNA surveillance complex, UPF2 (OMIM Ref. No. 605529) and UPF3A (OMIM Ref. No. 605530). Wortmannin and caffeine were found to inhibit the kinase activity of SMG1, whereas staurosporine and rapamycin did not. Inhibitors of SMG1 induced the accumulation of truncated p53 in human cancer cell lines.

[20032] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20033] Denning, G.; Jamieson, L.; Maquat, L. E.; Thompson, E. A.; Fields, A. P. : Cloning of a novel phosphatidylinositol kinase-related kinase: characterization of the human SMG-1 RNA surveillance protein. J. Biol. Chem. 276: 22709-22714, 2001. ; and

[20034] Yamashita, A.; Ohnishi, T.; Kashima, I.; Taya, Y.; Ohno, S. : Human SMG-1, a novel phosphatidylinositol 3-kinase-related protein kinase, associates with components of the mRNA surveillan.

[20035] Further studies establishing the function and utilities of SMG1 are found in John Hopkins OMIM database record ID 607032, and in sited publications numbered 5386-5387,

110 and 5137 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Tumor Necrosis Factor (ligand) Superfamily, Member 15 (TNFSF15, Accession NM\_005118) is another VGAM419 host target gene. TNFSF15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNFSF15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFSF15 BINDING SITE, designated SEQ ID:11602, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20036] Another function of VGAM419 is therefore inhibition of Tumor Necrosis Factor (ligand) Superfamily, Member 15 (TNFSF15, Accession NM\_005118), a gene which acts as an autocrine factor to induce apoptosis in endothelial cells. Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFSF15. The function of TNFSF15 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM350. Vanin 1

(VNN1, Accession NM\_004666) is another VGAM419 host target gene. VNN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VNN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VNN1 BINDING SITE, designated SEQ ID:11039, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20037] Another function of VGAM419 is therefore inhibition of Vanin 1 (VNN1, Accession NM\_004666), a gene which may regulate steps in thymus homing and play a role in mammalian sexual development. Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VNN1. The function of VNN1 has been established by previous studies. Hematopoietic precursor cells migrate to the thymus, where they differentiate into mature T lymphocytes. Aurrand-Lions et al. (1996) reported the cDNA cloning and functional analysis of mouse vanin-1 (vascular noninflammatory molecule-1), a novel cell surface molecule that is involved in the thymus homing of bone marrow

cells. Vanin-1 is a glycosylphosphatidylinositol (GPI)-anchored molecule expressed by perivascular thymic stromal cells. Antibody against vanin-1 blocked thymus colonization by hematopoietic progenitor cells in both short- and long-term assays and interfered with lymphostromal cell adhesion. The authors suggested that vanin-1 regulates late adhesion steps of thymus homing under physiologic, noninflammatory conditions. The mammalian sex-determining pathway is controlled by the presence or absence of SRY (OMIM Ref. No. 480000) expression in the embryonic gonad. To identify additional sex-determining or gonadal differentiation genes, Grimmond et al. (2000) screened for genes exhibiting sexually dimorphic patterns of expression in the mouse gonad at 12.5 and 13.5 days postcoitum, after overt gonad differentiation, by comparing complex cDNA probes derived from male and female gonadal tissue at these stages on microarrays constructed from a normalized urogenital ridge library. Using in situ hybridization analysis, they determined that mouse protease nexin-1 (OMIM Ref. No. 177010) and Vnn1 exhibit male-specific expression prior to overt gonadal differentiation and are detected in the somatic portion of the developing gonad, suggesting to

the authors a possible direct link to the testis–determining pathway for both genes.

[20038] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20039] Aurrand–Lions, M.; Galland, F.; Bazin, H.; Zakharyev, V. M.; Imhof, B. A.; Naquet, P. : Vanin–1, a novel GPI–linked perivascular molecule involved in thymus homing. *Immunity* 5: 391–405, 1996. ; and

[20040] Grimmond, S.; Van Hateren, N.; Siggers, P.; Arkell, R.; Larder, R.; Soares, M. B.; de Fatima Bonaldo, M.; Smith, L.; Tymowska–Lalanne, Z.; Wells, C.; Greenfield, A. : Sexually dimorphic ex.

[20041] Further studies establishing the function and utilities of VNN1 are found in John Hopkins OMIM database record ID 603570, and in cited publications numbered 5355–5356, 1 and 5357–5358 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. AP1 Gamma Subunit Binding Protein 1 (AP1GBP1, Accession NM\_080551) is another VGAM419 host target gene. AP1GBP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AP1GBP1, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP1GBP1 BINDING SITE, designated SEQ ID:27881, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20042] Another function of VGAM419 is therefore inhibition of AP1 Gamma Subunit Binding Protein 1 (AP1GBP1, Accession NM\_080551). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1GBP1. BC022889 (Accession XM\_096964) is another VGAM419 host target gene. BC022889 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BC022889, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BC022889 BINDING SITE, designated SEQ ID:40687, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20043] Another function of VGAM419 is therefore inhibition of BC022889 (Accession XM\_096964). Accordingly, utilities

of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BC022889. C1q and Tumor Necrosis Factor Related Protein 2 (C1QTNF2, Accession NM\_031908) is another VGAM419 host target gene. C1QTNF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1QTNF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1QTNF2 BINDING SITE, designated SEQ ID:25653, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20044] Another function of VGAM419 is therefore inhibition of C1q and Tumor Necrosis Factor Related Protein 2 (C1QTNF2, Accession NM\_031908). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1QTNF2. Chromosome 20 Open Reading Frame 12 (C20orf12, Accession NM\_018152) is another VGAM419 host target gene. C20orf12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf12, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf12 BINDING SITE, designated SEQ ID:19962, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20045] Another function of VGAM419 is therefore inhibition of Chromosome 20 Open Reading Frame 12 (C20orf12, Accession NM\_018152). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf12. Chromosome 20 Open Reading Frame 177 (C20orf177, Accession XM\_030726) is another VGAM419 host target gene. C20orf177 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf177, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf177 BINDING SITE, designated SEQ ID:31130, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20046] Another function of VGAM419 is therefore inhibition of

Chromosome 20 Open Reading Frame 177 (C20orf177, Accession XM\_030726). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf177. Cullin 4A (CUL4A, Accession NM\_003589) is another VGAM419 host target gene. CUL4A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CUL4A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CUL4A BINDING SITE, designated SEQ ID:9642, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20047] Another function of VGAM419 is therefore inhibition of Cullin 4A (CUL4A, Accession NM\_003589). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CUL4A. Deiodinase, Iodothyronine, Type II (DIO2, Accession NM\_013989) is another VGAM419 host target gene. DIO2 BINDING SITE1 and DIO2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DIO2, corresponding to HOST TAR-

GET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DIO2 BINDING SITE1 and DIO2 BINDING SITE2, designated SEQ ID:15172 and SEQ ID:6461 respectively, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20048] Another function of VGAM419 is therefore inhibition of Deiodinase, Iodothyronine, Type II (DIO2, Accession NM\_013989). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIO2. FLJ12660 (Accession NM\_025152) is another VGAM419 host target gene. FLJ12660 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12660, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12660 BINDING SITE, designated SEQ ID:24788, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20049] Another function of VGAM419 is therefore inhibition of

FLJ12660 (Accession NM\_025152). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12660. FLJ12876 (Accession NM\_022754) is another VGAM419 host target gene. FLJ12876 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12876, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12876 BINDING SITE, designated SEQ ID:22988, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20050] Another function of VGAM419 is therefore inhibition of FLJ12876 (Accession NM\_022754). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12876. FLJ20006 (Accession NM\_017618) is another VGAM419 host target gene. FLJ20006 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20006, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ20006 BINDING SITE, designated SEQ ID:19120, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20051] Another function of VGAM419 is therefore inhibition of FLJ20006 (Accession NM\_017618). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20006. FLJ21240 (Accession NM\_024847) is another VGAM419 host target gene. FLJ21240 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21240, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21240 BINDING SITE, designated SEQ ID:24281, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20052] Another function of VGAM419 is therefore inhibition of FLJ21240 (Accession NM\_024847). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21240. KIAA0255 (Accession NM\_014742) is another VGAM419

host target gene. KIAA0255 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0255, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0255 BINDING SITE, designated SEQ ID:16414, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20053] Another function of VGAM419 is therefore inhibition of KIAA0255 (Accession NM\_014742). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0255. KIAA0268 (Accession XM\_046126) is another VGAM419 host target gene. KIAA0268 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0268 BINDING SITE, designated SEQ ID:34689, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20054] Another function of VGAM419 is therefore inhibition of KIAA0268 (Accession XM\_046126). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0268. KIAA1126 (Accession XM\_050325) is another VGAM419 host target gene. KIAA1126 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1126, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1126 BINDING SITE, designated SEQ ID:35612, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20055] Another function of VGAM419 is therefore inhibition of KIAA1126 (Accession XM\_050325). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1126. KIAA1473 (Accession XM\_047550) is another VGAM419 host target gene. KIAA1473 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1473, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1473 BINDING SITE, designated SEQ ID:34998, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20056] Another function of VGAM419 is therefore inhibition of KIAA1473 (Accession XM\_047550). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1473. KIAA1649 (Accession XM\_040095) is another VGAM419 host target gene. KIAA1649 BINDING SITE1 and KIAA1649 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1649, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1649 BINDING SITE1 and KIAA1649 BINDING SITE2, designated SEQ ID:33255 and SEQ ID:26103 respectively, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20057] Another function of VGAM419 is therefore inhibition of KIAA1649 (Accession XM\_040095). Accordingly, utilities

of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1649. Mitochondrial Ribosomal Protein L35 (MRPL35, Accession NM\_016622) is another VGAM419 host target gene. MRPL35 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MRPL35, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPL35 BINDING SITE, designated SEQ ID:18734, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20058] Another function of VGAM419 is therefore inhibition of Mitochondrial Ribosomal Protein L35 (MRPL35, Accession NM\_016622). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL35. PDZ Domain Containing 2 (PDZD2, Accession XM\_087705) is another VGAM419 host target gene. PDZD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDZD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDZD2 BINDING SITE, designated SEQ ID:39399, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20059] Another function of VGAM419 is therefore inhibition of PDZ Domain Containing 2 (PDZD2, Accession XM\_087705). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDZD2. PRO0478 (Accession NM\_014129) is another VGAM419 host target gene. PRO0478 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO0478, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0478 BINDING SITE, designated SEQ ID:15398, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20060] Another function of VGAM419 is therefore inhibition of PRO0478 (Accession NM\_014129). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with PRO0478. SARM (Accession NM\_015077) is another VGAM419 host target gene. SARM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SARM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SARM BINDING SITE, designated SEQ ID:17452, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20061] Another function of VGAM419 is therefore inhibition of SARM (Accession NM\_015077). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SARM. Sperm Specific Antigen 2 (SSFA2, Accession XM\_057458) is another VGAM419 host target gene. SSFA2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SSFA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSFA2 BINDING SITE, designated SEQ ID:36515, to the nu-

cleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20062] Another function of VGAM419 is therefore inhibition of Sperm Specific Antigen 2 (SSFA2, Accession XM\_057458). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSFA2. Tripartite Motif-containing 22 (TRIM22, Accession NM\_006074) is another VGAM419 host target gene. TRIM22 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM22 BINDING SITE, designated SEQ ID:12719, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20063] Another function of VGAM419 is therefore inhibition of Tripartite Motif-containing 22 (TRIM22, Accession NM\_006074). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM22. Zinc Finger Protein 347 (ZNF347, Accession NM\_032584) is another

VGAM419 host target gene. ZNF347 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF347, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF347 BINDING SITE, designated SEQ ID:26320, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20064] Another function of VGAM419 is therefore inhibition of Zinc Finger Protein 347 (ZNF347, Accession NM\_032584). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF347. LOC119504 (Accession XM\_058400) is another VGAM419 host target gene. LOC119504 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC119504, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC119504 BINDING SITE, designated SEQ ID:36616, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3130.

[20065] Another function of VGAM419 is therefore inhibition of LOC119504 (Accession XM\_058400). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC119504. LOC126382 (Accession XM\_072027) is another VGAM419 host target gene. LOC126382 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC126382, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126382 BINDING SITE, designated SEQ ID:37456, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20066] Another function of VGAM419 is therefore inhibition of LOC126382 (Accession XM\_072027). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126382. LOC128977 (Accession XM\_059313) is another VGAM419 host target gene. LOC128977 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC128977, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC128977 BINDING SITE, designated SEQ ID:36948, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20067] Another function of VGAM419 is therefore inhibition of LOC128977 (Accession XM\_059313). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128977. LOC131744 (Accession XM\_067529) is another VGAM419 host target gene. LOC131744 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC131744, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC131744 BINDING SITE, designated SEQ ID:37359, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20068] Another function of VGAM419 is therefore inhibition of LOC131744 (Accession XM\_067529). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC131744. LOC144465 (Accession XM\_084874) is another VGAM419 host target gene. LOC144465 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144465 BINDING SITE, designated SEQ ID:37753, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20069] Another function of VGAM419 is therefore inhibition of LOC144465 (Accession XM\_084874). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144465. LOC145216 (Accession XM\_096730) is another VGAM419 host target gene. LOC145216 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145216, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145216 BINDING SITE, designated SEQ ID:40510, to

the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20070] Another function of VGAM419 is therefore inhibition of LOC145216 (Accession XM\_096730). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145216. LOC148894 (Accession XM\_097542) is another VGAM419 host target gene. LOC148894 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148894, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148894 BINDING SITE, designated SEQ ID:40921, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20071] Another function of VGAM419 is therefore inhibition of LOC148894 (Accession XM\_097542). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148894. LOC148932 (Accession XM\_086372) is another VGAM419 host target gene. LOC148932 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC148932, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148932 BINDING SITE, designated SEQ ID:38625, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20072] Another function of VGAM419 is therefore inhibition of LOC148932 (Accession XM\_086372). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148932. LOC149113 (Accession XM\_086425) is another VGAM419 host target gene. LOC149113 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149113, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149113 BINDING SITE, designated SEQ ID:38642, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20073] Another function of VGAM419 is therefore inhibition of LOC149113 (Accession XM\_086425). Accordingly, utilities

of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149113. LOC150630 (Accession XM\_097931) is another VGAM419 host target gene. LOC150630 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150630, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150630 BINDING SITE, designated SEQ ID:41244, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20074] Another function of VGAM419 is therefore inhibition of LOC150630 (Accession XM\_097931). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150630. LOC154403 (Accession XM\_087919) is another VGAM419 host target gene. LOC154403 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154403, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC154403 BINDING SITE, designated SEQ ID:39470, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20075] Another function of VGAM419 is therefore inhibition of LOC154403 (Accession XM\_087919). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154403. LOC154992 (Accession XM\_088106) is another VGAM419 host target gene. LOC154992 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154992, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154992 BINDING SITE, designated SEQ ID:39520, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20076] Another function of VGAM419 is therefore inhibition of LOC154992 (Accession XM\_088106). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154992. LOC196812 (Accession XM\_116868) is another VGAM419 host target gene. LOC196812 BINDING

SITE is HOST TARGET binding site found in the 3` un-translated region of mRNA encoded by LOC196812, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196812 BINDING SITE, designated SEQ ID:43140, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20077] Another function of VGAM419 is therefore inhibition of LOC196812 (Accession XM\_116868). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196812. LOC199858 (Accession XM\_114040) is another VGAM419 host target gene. LOC199858 BINDING SITE is HOST TARGET binding site found in the 5` un-translated region of mRNA encoded by LOC199858, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199858 BINDING SITE, designated SEQ ID:42643, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20078] Another function of VGAM419 is therefore inhibition of

LOC199858 (Accession XM\_114040). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199858. LOC201868 (Accession XM\_114393) is another VGAM419 host target gene. LOC201868 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201868, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201868 BINDING SITE, designated SEQ ID:42923, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20079] Another function of VGAM419 is therefore inhibition of LOC201868 (Accession XM\_114393). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201868. LOC201911 (Accession XM\_117339) is another VGAM419 host target gene. LOC201911 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201911, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC201911 BINDING SITE, designated SEQ ID:43391, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20080] Another function of VGAM419 is therefore inhibition of LOC201911 (Accession XM\_117339). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201911. LOC219722 (Accession XM\_167593) is another VGAM419 host target gene. LOC219722 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219722, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219722 BINDING SITE, designated SEQ ID:44713, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20081] Another function of VGAM419 is therefore inhibition of LOC219722 (Accession XM\_167593). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219722. LOC221431 (Accession XM\_166380) is an-

other VGAM419 host target gene. LOC221431 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221431, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221431 BINDING SITE, designated SEQ ID:44226, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20082] Another function of VGAM419 is therefore inhibition of LOC221431 (Accession XM\_166380). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221431. LOC254531 (Accession XM\_170773) is another VGAM419 host target gene. LOC254531 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254531, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254531 BINDING SITE, designated SEQ ID:45541, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20083] Another function of VGAM419 is therefore inhibition of LOC254531 (Accession XM\_170773). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254531. LOC90594 (Accession XM\_032820) is another VGAM419 host target gene. LOC90594 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90594, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90594 BINDING SITE, designated SEQ ID:31775, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20084] Another function of VGAM419 is therefore inhibition of LOC90594 (Accession XM\_032820). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90594. LOC90918 (Accession XM\_034863) is another VGAM419 host target gene. LOC90918 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90918, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90918 BINDING SITE, designated SEQ ID:32178, to the nucleotide sequence of VGAM419 RNA, herein designated VGAM RNA, also designated SEQ ID:3130.

[20085] Another function of VGAM419 is therefore inhibition of LOC90918 (Accession XM\_034863). Accordingly, utilities of VGAM419 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90918. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 420 (VGAM420) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20086] VGAM420 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM420 was detected is described hereinabove with reference to Figs. 1–8.

[20087] VGAM420 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Papillomavirus Type 39. VGAM420 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20088] VGAM420 gene encodes a VGAM420 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM420 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM420 precursor RNA is designated SEQ ID:406, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:406 is located at position 5287 relative to the genome of Human Papillomavirus Type 39.

[20089] VGAM420 precursor RNA folds onto itself, forming VGAM420 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20090] An enzyme complex designated DICER COMPLEX, `dices` the VGAM420 folded precursor RNA into VGAM420 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM420 RNA is designated SEQ ID:3131, and is provided hereinbelow with reference to the sequence listing part.

[20091] VGAM420 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM420 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM420 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[20092] VGAM420 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM420 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM420 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM420 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM420 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[20093] The complementary binding of VGAM420 RNA, herein designated VGAM RNA, to host target binding sites on VGAM420 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM420 host target RNA into VGAM420 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[20094] It is appreciated that VGAM420 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM420 host target genes. The mRNA of each one of this plurality of VGAM420 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM420 RNA, herein designated VGAM RNA, and which when bound by VGAM420 RNA causes inhibition of translation of respective one or more VGAM420 host target proteins.

[20095] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM420 gene, herein designated VGAM GENE, on one or more VGAM420 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[20096] It is yet further appreciated that a function of VGAM420 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM420 include diagnosis, prevention and treatment of viral infection by Human Papillomavirus Type 39. Specific functions, and accordingly utilities, of VGAM420 correlate with, and may be deduced from, the identity of the host target genes which VGAM420 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20097] Nucleotide sequences of the VGAM420 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM420 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM420 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM420 are further described hereinbelow with reference to Table 1.

[20098] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM420 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM420 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20099] As mentioned hereinabove with reference to Fig. 1, a function of VGAM420 gene, herein designated VGAM is inhibition of expression of VGAM420 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM420 correlate with, and may be deduced from, the identity of the target genes which VGAM420 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20100] Contactin 3 (plasmacytoma associated) (CNTN3, Accession XM\_039627) is a VGAM420 host target gene. CNTN3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNTN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNTN3 BINDING SITE, designated SEQ ID:33131, to the nucleotide sequence of VGAM420 RNA, herein designated

VGAM RNA, also designated SEQ ID:3131.

[20101] A function of VGAM420 is therefore inhibition of Contactin 3 (plasmacytoma associated) (CNTN3, Accession XM\_039627), a gene which may play a role in the initial growth and guidance of axons. Accordingly, utilities of VGAM420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNTN3. The function of CNTN3 has been established by previous studies. Pang, a mouse gene encoding a neuronal adhesion molecule, was isolated as a plasmacytoma-specific transcript using an RT-PCR-based strategy in an attempt to isolate Myc-like genes in murine plasmacytomas (Connelly et al., 1994). Pang is a member of the immunoglobulin/fibronectin superfamily of adhesion molecules; its closest relatives, TAG1 (OMIM Ref. No. 190197) and contactin 1 (OMIM Ref. No. 600016), promote axon growth and migration. The normal site of Pang expression is the brain, where it is detected as 4.0- and 6.1-kb RNAs on Northern blots; Pang is not detected in other normal tissues. Abnormally sized Pang transcripts were uniquely found in murine plasmacytomas, where it is ectopically activated by intracisternal A-type particle long terminal repeats. Mock et al. (1996) mapped the Pang

gene to mouse chromosome 6 by somatic cell hybrid analysis and further positioned it on the chromosome between Wnt7a and Pcp1. Southern blot analysis of human-rodent somatic cell hybrids together with predictions from the mouse map location indicated that human PANG is located at 3p26

[20102] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20103] Connelly, M. A.; Grady, R. C.; Mushinski, J. F.; Marcu, K. B. : PANG, a gene encoding a neuronal glycoprotein, is ectopically activated by intracisternal A-type particle long terminal repeats in murine plasmacytomas. Proc. Nat. Acad. Sci. 91: 1337-1341, 1994. ; and

[20104] Mock, B. A.; Connelly, M. A.; McBride, O. W.; Kozak, C. A.; Marcu, K. B. : Plasmacytoma-associated neuronal glycoprotein, Pang, maps to mouse chromosome 6 and human chromosome 3. Genomic.

[20105] Further studies establishing the function and utilities of CNTN3 are found in John Hopkins OMIM database record ID 601325, and in cited publications numbered 9388-9389 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Heme

Oxygenase (decycling) 1 (HMOX1, Accession NM\_002133) is another VGAM420 host target gene. HMOX1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HMOX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMOX1 BINDING SITE, designated SEQ ID:7909, to the nucleotide sequence of VGAM420 RNA, herein designated VGAM RNA, also designated SEQ ID:3131.

[20106] Another function of VGAM420 is therefore inhibition of Heme Oxygenase (decycling) 1 (HMOX1, Accession NM\_002133). Accordingly, utilities of VGAM420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMOX1. Nuclear Receptor Coactivator 4 (NCOA4, Accession NM\_005437) is another VGAM420 host target gene. NCOA4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NCOA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCOA4 BINDING SITE, designated SEQ ID:11921, to the nucleotide se-

quence of VGAM420 RNA, herein designated VGAM RNA, also designated SEQ ID:3131.

[20107] Another function of VGAM420 is therefore inhibition of Nuclear Receptor Coactivator 4 (NCOA4, Accession NM\_005437), a gene which Binds and activates androgen receptor (AR) in ligand-dependent manner. Accordingly, utilities of VGAM420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCOA4. The function of NCOA4 has been established by previous studies. The PTC3 oncogene (RET/PTC3) is an activated form of the RET protooncogene (OMIM Ref. No. 164761), which is frequently rearranged in papillary thyroid carcinoma (OMIM Ref. No. 188550). RET/PTC3 results from a structural rearrangement between the ELE1 and RET genes (Bongarzone et al., 1994), and has been observed in both sporadic and radiation-associated post-Chernobyl papillary thyroid carcinoma. To understand the molecular basis that predisposes RET and ELE1 genes to be recurrent targets of 'illegitimate' recombination, Bongarzone et al. (1997) examined the genomic regions containing the ELE1/RET breakpoints in 6 Italian sporadic, RET/PTC3-positive tumors and 3 radiation-associated tumors from children living in areas contaminated by the

Chernobyl accident; the latter tumors also expressed RET/PTC3 oncogene. They found that the breakpoints in both genes clustered in regions that they designated ELE1-bcr (OMIM Ref. No. 1.8 kb) and RET-bcr (OMIM Ref. No. 1.9 kb). In all sporadic tumors and in 1 post-Chernobyl tumor, the ELE1/RET recombination corresponded with short sequences of homology (3 to 7 bp) between the 2 rearranging genes. In addition, Bongarzone et al. (1997) observed an interesting distribution of the post-Chernobyl breakpoints in ELE1-bcr located within an Alu element, or between 2 close Alu elements, and always in AT-rich regions. In the case of the ELE1/RET fusion gene, the 5-prime end of ELE1 is fused to the tyrosine kinase portion of the RET gene. See 601985 for discussion of the PTC1 chimeric oncogene. Androgen receptor (AR; 313700) is a transcriptional factor that belongs to the steroid receptor superfamily based on its structural similarities. Yeh and Chang (1996) noted that members of this family are characterized by 3 major structural regions: a variable amino-terminal domain, a highly conserved cysteine-rich DNA-binding domain, and a carboxyl-terminal ligand-binding domain. When bound to androgens and a cis-acting androgen-responsive element, AR can up- or

down-regulate the expression of androgen target genes through a complicated process that may require other adaptors or coactivators. The fundamental issue in the regulation of steroid hormones is the question of how specific transcription can be achieved in vivo when several receptors, such as AR, glucocorticoid receptor (OMIM Ref. No. 138040), and progesterone receptor (OMIM Ref. No. 607311) can recognize the same DNA sequence. It had been speculated that some accessory factors may selectively interact with the androgen receptor to determine the specificity of AR target gene activation. Using a yeast 2-hybrid system, Yeh and Chang (1996) cloned and characterized a specific AR coactivator. They designated the coactivator ARA(70). The cDNA they isolated encodes a 614-amino acid polypeptide with a predicted molecular weight of 70 kD. The predicted protein shares 99% homology with that encoded by a cDNA clone called RET-fused gene (RFG) that was isolated previously from human thyroid by Santoro et al. (1994). Yeh and Chang (1996) showed that ARA(70) is a ligand-dependent AR-associated protein which functions in human prostate cancer cells as an activator to enhance AR transcriptional activity 10-fold in the presence of dihydrotestosterone or

testosterone, but not hydroxyflutamide. ARA(70) induced only slightly the transcriptional activity of other steroid receptors such as estrogen receptor (OMIM Ref. No. 133430) in human prostate cancer cells.

[20108] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20109] Bongarzone, I.; Butti, M. G.; Fugazzola, L.; Pacini, F.; Pinchera, A.; Vorontsova, T. V.; Demidchik, E. P.; Pierotti, M. A. : Comparison of the breakpoint regions of ELE1 and RET genes involved in the generation of RET/PTC3 onco-gene in sporadic and in radiation-associated papillary thyroid carcinomas. Genomics 42: 252–259, 1997. ; and

[20110] Lim, H. N.; Hawkins, J. R.; Hughes, I. A. : Genetic evidence to exclude the androgen receptor co-factor, ARA70 (NCOA4) as a candidate gene for the causation of under-masculinised genital.

[20111] Further studies establishing the function and utilities of NCOA4 are found in John Hopkins OMIM database record ID 601984, and in cited publications numbered 10594–8896 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Neurogenic Differentiation 1 (NEUROD1, Accession

NM\_002500) is another VGAM420 host target gene. NEUROD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEUROD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEUROD1 BINDING SITE, designated SEQ ID:8322, to the nucleotide sequence of VGAM420 RNA, herein designated VGAM RNA, also designated SEQ ID:3131.

[20112] Another function of VGAM420 is therefore inhibition of Neurogenic Differentiation 1 (NEUROD1, Accession NM\_002500), a gene which acts as a differentiation factor during neurogenesis. Accordingly, utilities of VGAM420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEUROD1. The function of NEUROD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM130. Phosphodiesterase 4D, CAMP-specific (phosphodiesterase E3 dunce homolog, Drosophila) (PDE4D, Accession XM\_056815) is another VGAM420 host target gene. PDE4D BINDING SITE is HOST TARGET binding

site found in the 3' untranslated region of mRNA encoded by PDE4D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE4D BINDING SITE, designated SEQ ID:36424, to the nucleotide sequence of VGAM420 RNA, herein designated VGAM RNA, also designated SEQ ID:3131.

[20113] Another function of VGAM420 is therefore inhibition of Phosphodiesterase 4D, CAMP-specific (phosphodiesterase E3 dunce homolog, Drosophila) (PDE4D, Accession XM\_056815), a gene which has similarity to Drosophila dnc, which is the affected protein in learning and memory mutant dunce. Accordingly, utilities of VGAM420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE4D. The function of PDE4D and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM180. Apolipoprotein L, 6 (APOL6, Accession NM\_030641) is another VGAM420 host target gene. APOL6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APOL6,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APOL6 BINDING SITE, designated SEQ ID:24973, to the nucleotide sequence of VGAM420 RNA, herein designated VGAM RNA, also designated SEQ ID:3131.

[20114] Another function of VGAM420 is therefore inhibition of Apolipoprotein L, 6 (APOL6, Accession NM\_030641). Accordingly, utilities of VGAM420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOL6. DKFZP761L0424 (Accession XM\_166112) is another VGAM420 host target gene. DKFZP761L0424 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP761L0424, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP761L0424 BINDING SITE, designated SEQ ID:43891, to the nucleotide sequence of VGAM420 RNA, herein designated VGAM RNA, also designated SEQ ID:3131.

[20115] Another function of VGAM420 is therefore inhibition of

DKFZP761L0424 (Accession XM\_166112). Accordingly, utilities of VGAM420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP761L0424. FLJ20312 (Accession NM\_017761) is another VGAM420 host target gene. FLJ20312 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20312, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20312 BINDING SITE, designated SEQ ID:19372, to the nucleotide sequence of VGAM420 RNA, herein designated VGAM RNA, also designated SEQ ID:3131.

[20116] Another function of VGAM420 is therefore inhibition of FLJ20312 (Accession NM\_017761). Accordingly, utilities of VGAM420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20312. KIAA1950 (Accession XM\_166532) is another VGAM420 host target gene. KIAA1950 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1950, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of KIAA1950 BINDING SITE, designated SEQ ID:44481, to the nucleotide sequence of VGAM420 RNA, herein designated VGAM RNA, also designated SEQ ID:3131.

[20117] Another function of VGAM420 is therefore inhibition of KIAA1950 (Accession XM\_166532). Accordingly, utilities of VGAM420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1950. MGC5391 (Accession NM\_032740) is another VGAM420 host target gene. MGC5391 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC5391, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5391 BINDING SITE, designated SEQ ID:26470, to the nucleotide sequence of VGAM420 RNA, herein designated VGAM RNA, also designated SEQ ID:3131.

[20118] Another function of VGAM420 is therefore inhibition of MGC5391 (Accession NM\_032740). Accordingly, utilities of VGAM420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5391. RING1 and YY1 Binding Protein (RYBP, Acces-

sion XM\_002853) is another VGAM420 host target gene. RYBP BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RYBP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RYBP BINDING SITE, designated SEQ ID:29907, to the nucleotide sequence of VGAM420 RNA, herein designated VGAM RNA, also designated SEQ ID:3131.

[20119] Another function of VGAM420 is therefore inhibition of RING1 and YY1 Binding Protein (RYBP, Accession XM\_002853). Accordingly, utilities of VGAM420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RYBP. LOC255533 (Accession XM\_173073) is another VGAM420 host target gene. LOC255533 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC255533, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255533 BINDING SITE, designated SEQ ID:46328, to the nucleotide sequence of VGAM420 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3131.

[20120] Another function of VGAM420 is therefore inhibition of LOC255533 (Accession XM\_173073). Accordingly, utilities of VGAM420 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255533. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 421 (VGAM421) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20121] VGAM421 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM421 was detected is described hereinabove with reference to Figs. 1–8.

[20122] VGAM421 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Human Papillomavirus Type 39. VGAM421 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20123] VGAM421 gene encodes a VGAM421 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM421 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM421 precursor RNA is designated SEQ ID:407, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:407 is located at position 4323 relative to the genome of Human Papillomavirus Type 39.

[20124] VGAM421 precursor RNA folds onto itself, forming VGAM421 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20125] An enzyme complex designated DICER COMPLEX, `dices` the VGAM421 folded precursor RNA into VGAM421 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM421 RNA is designated SEQ ID:3132, and is provided hereinbelow with reference to the sequence listing part.

[20126] VGAM421 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM421 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM421 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[20127] VGAM421 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM421 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM421 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM421 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM421 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[20128] The complementary binding of VGAM421 RNA, herein designated VGAM RNA, to host target binding sites on VGAM421 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM421 host target RNA into VGAM421 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20129] It is appreciated that VGAM421 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM421 host target genes. The mRNA of

each one of this plurality of VGAM421 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM421 RNA, herein designated VGAM RNA, and which when bound by VGAM421 RNA causes inhibition of translation of respective one or more VGAM421 host target proteins.

[20130] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM421 gene, herein designated VGAM GENE, on one or more VGAM421 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[20131] It is yet further appreciated that a function of VGAM421 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM421 include diagnosis, prevention and treatment of viral infection by Human Papillomavirus Type 39. Specific functions, and accordingly utilities, of VGAM421 correlate with, and may be deduced from, the identity of the host target genes which VGAM421 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20132] Nucleotide sequences of the VGAM421 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM421 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM421 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM421 are further described hereinbelow with reference to Table 1.

[20133] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM421 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM421 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[20134] As mentioned hereinabove with reference to Fig. 1, a function of VGAM421 gene, herein designated VGAM is inhibition of expression of VGAM421 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM421 correlate with, and may be deduced from, the identity of the target genes which VGAM421 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20135] MADS Box Transcription Enhancer Factor 2, Polypeptide C (myocyte enhancer factor 2C) (MEF2C, Accession NM\_002397) is a VGAM421 host target gene. MEF2C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MEF2C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEF2C BINDING SITE, designated SEQ ID:8210, to the nucleotide sequence of VGAM421 RNA, herein designated VGAM RNA, also designated SEQ ID:3132.

[20136] A function of VGAM421 is therefore inhibition of MADS Box Transcription Enhancer Factor 2, Polypeptide C

(myocyte enhancer factor 2C) (MEF2C, Accession NM\_002397), a gene which regulates muscle-specific and mitogen-inducible genes. Accordingly, utilities of VGAM421 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEF2C. The function of MEF2C and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM386. Sal-like 1 (Drosophila) (SALL1, Accession NM\_002968) is another VGAM421 host target gene. SALL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SALL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SALL1 BINDING SITE, designated SEQ ID:8880, to the nucleotide sequence of VGAM421 RNA, herein designated VGAM RNA, also designated SEQ ID:3132.

[20137] Another function of VGAM421 is therefore inhibition of Sal-like 1 (Drosophila) (SALL1, Accession NM\_002968). Accordingly, utilities of VGAM421 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SALL1. Enabled Homolog (Drosophila)

(ENAH, Accession NM\_018212) is another VGAM421 host target gene. ENAH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ENAH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENAH BINDING SITE, designated SEQ ID:20126, to the nucleotide sequence of VGAM421 RNA, herein designated VGAM RNA, also designated SEQ ID:3132.

[20138] Another function of VGAM421 is therefore inhibition of Enabled Homolog (Drosophila) (ENAH, Accession NM\_018212). Accordingly, utilities of VGAM421 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENAH. KIAA0556 (Accession XM\_044632) is another VGAM421 host target gene. KIAA0556 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0556, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0556 BINDING SITE, designated SEQ ID:34249, to the nucleotide sequence of VGAM421 RNA,

herein designated VGAM RNA, also designated SEQ ID:3132.

[20139] Another function of VGAM421 is therefore inhibition of KIAA0556 (Accession XM\_044632). Accordingly, utilities of VGAM421 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0556. KIAA0648 (Accession XM\_094043) is another VGAM421 host target gene. KIAA0648 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0648, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0648 BINDING SITE, designated SEQ ID:40220, to the nucleotide sequence of VGAM421 RNA, herein designated VGAM RNA, also designated SEQ ID:3132.

[20140] Another function of VGAM421 is therefore inhibition of KIAA0648 (Accession XM\_094043). Accordingly, utilities of VGAM421 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0648. LOC143465 (Accession XM\_096430) is another VGAM421 host target gene. LOC143465 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by LOC143465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143465 BINDING SITE, designated SEQ ID:40361, to the nucleotide sequence of VGAM421 RNA, herein designated VGAM RNA, also designated SEQ ID:3132.

[20141] Another function of VGAM421 is therefore inhibition of LOC143465 (Accession XM\_096430). Accordingly, utilities of VGAM421 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143465. LOC147599 (Accession XM\_097253) is another VGAM421 host target gene. LOC147599 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147599, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147599 BINDING SITE, designated SEQ ID:40847, to the nucleotide sequence of VGAM421 RNA, herein designated VGAM RNA, also designated SEQ ID:3132.

[20142] Another function of VGAM421 is therefore inhibition of LOC147599 (Accession XM\_097253). Accordingly, utilities

of VGAM421 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147599. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 422 (VGAM422) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20143] VGAM422 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM422 was detected is described hereinabove with reference to Figs. 1–8.

[20144] VGAM422 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Canine Parvovirus. VGAM422 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20145] VGAM422 gene encodes a VGAM422 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM422 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM422 precursor RNA is designated SEQ ID:408, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:408 is located at position 1869 relative to the genome of Canine Parvovirus.

[20146] VGAM422 precursor RNA folds onto itself, forming VGAM422 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20147] An enzyme complex designated DICER COMPLEX, `dices` the VGAM422 folded precursor RNA into VGAM422 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM422 RNA is designated SEQ ID:3133, and

is provided hereinbelow with reference to the sequence listing part.

[20148] VGAM422 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM422 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM422 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[20149] VGAM422 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM422 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM422 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM422 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM422 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[20150] The complementary binding of VGAM422 RNA, herein designated VGAM RNA, to host target binding sites on VGAM422 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM422 host target RNA into VGAM422 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20151] It is appreciated that VGAM422 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM422 host target genes. The mRNA of each one of this plurality of VGAM422 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM422 RNA, herein designated VGAM RNA, and which when bound by VGAM422 RNA causes inhibition of translation of respective one or more VGAM422 host target proteins.

[20152] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM422 gene, herein designated VGAM GENE, on one or more VGAM422 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[20153] It is yet further appreciated that a function of VGAM422 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM422 include diagnosis, prevention and treatment of viral infection by Canine Parvovirus. Specific functions, and accordingly utilities, of VGAM422 correlate with, and may be deduced from, the identity of the host target genes which VGAM422 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20154] Nucleotide sequences of the VGAM422 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM422 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM422 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM422 are further described hereinbelow with reference to Table 1.

[20155] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM422 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM422 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20156] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM422 gene, herein designated VGAM is inhibition of expression of VGAM422 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM422 correlate with, and may be deduced from, the identity of the target genes which VGAM422 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20157] Pumilio Homolog 1 (Drosophila) (PUM1, Accession NM\_014676) is a VGAM422 host target gene. PUM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PUM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PUM1 BINDING SITE, designated SEQ ID:16147, to the nucleotide sequence of VGAM422 RNA, herein designated VGAM RNA, also designated SEQ ID:3133.

[20158] A function of VGAM422 is therefore inhibition of Pumilio Homolog 1 (Drosophila) (PUM1, Accession NM\_014676), a gene which is a human homolog of the Drosophila Pumilio protein. Accordingly, utilities of VGAM422 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PUM1. The function of PUM1

has been established by previous studies. By sequencing cDNAs randomly selected from a cDNA library derived from the human immature myeloid cell line KG-1, Nagase et al. (1995) isolated a cDNA encoding PUM1, a human homolog of the *Drosophila* Pumilio protein, which they designated KIAA0099. The predicted 1,186-amino acid KIAA0099 protein is 42.1% identical to *Drosophila* Pumilio over an 875-amino acid region . Northern blot analysis detected expression of KIAA0099 in all tissues tested. Wang et al. (2002) determined the structure of the RNA-binding domain of human PUM1 bound to a high-affinity RNA ligand. The RNA binds the concave surface of the molecule, where each of the protein's 8 repeats makes contact with a different RNA base via 3 amino acid side chains at conserved positions. Wang et al. (2002) mutated these 3 side chains in 1 repeat, thereby altering the sequence specificity of PUM1. They concluded that the high affinity and specificity of the PUM homology domain for RNA is achieved using multiple copies of a simple repeated motif.

[20159] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [20160] Nagase, T; Miyajima, N; Tanaka, A.; Sazuka, T.; Seki, N.; Sato, S.; Tabata, S.; Ishikawa, K.; Kawarabayashi, Y.; Kotani, H.; Nomura, N. : Prediction of the coding sequences of unidentified human genes. III. The coding sequences of 40 new genes (KIAA0081–KIAA0120) deduced by analysis of cDNA clones from human cell line KG–1. DNA Res. 2: 37–43, 1995. ; and
- [20161] Wang, X.; McLachlan, J.; Zamore, P. D.; Hall, T. M. T. : Modular recognition of RNA by a human Pumilio–homology domain. Cell 110: 501–512, 2002.
- [20162] Further studies establishing the function and utilities of PUM1 are found in John Hopkins OMIM database record ID 607204, and in cited publications numbered 6726 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. SRY (sex determining region Y)–box 13 (SOX13, Accession NM\_005686) is another VGAM422 host target gene. SOX13 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SOX13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOX13 BINDING SITE, designated SEQ ID:12241, to the nucleotide se–

quence of VGAM422 RNA, herein designated VGAM RNA, also designated SEQ ID:3133.

[20163] Another function of VGAM422 is therefore inhibition of SRY (sex determining region Y)-box 13 (SOX13, Accession NM\_005686). Accordingly, utilities of VGAM422 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX13. Down Syndrome Critical Region Gene 1-like 1 (DSCR1L1, Accession NM\_005822) is another VGAM422 host target gene. DSCR1L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DSCR1L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DSCR1L1 BINDING SITE, designated SEQ ID:12428, to the nucleotide sequence of VGAM422 RNA, herein designated VGAM RNA, also designated SEQ ID:3133.

[20164] Another function of VGAM422 is therefore inhibition of Down Syndrome Critical Region Gene 1-like 1 (DSCR1L1, Accession NM\_005822). Accordingly, utilities of VGAM422 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSCR1L1. Fig. 1

further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 423 (VGAM423) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20165] VGAM423 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM423 was detected is described hereinabove with reference to Figs. 1–8.

[20166] VGAM423 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Canine Parvovirus. VGAM423 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20167] VGAM423 gene encodes a VGAM423 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM423 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM423 precursor RNA is designated SEQ ID:409, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:409 is

located at position 1298 relative to the genome of Canine Parvovirus.

[20168] VGAM423 precursor RNA folds onto itself, forming VGAM423 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20169] An enzyme complex designated DICER COMPLEX, `dices` the VGAM423 folded precursor RNA into VGAM423 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM423 RNA is designated SEQ ID:3134, and is provided hereinbelow with reference to the sequence listing part.

[20170] VGAM423 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM423 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM423 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[20171] VGAM423 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM423 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM423 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM423 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM423 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[20172] The complementary binding of VGAM423 RNA, herein designated VGAM RNA, to host target binding sites on VGAM423 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM423 host target RNA into VGAM423 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20173] It is appreciated that VGAM423 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM423 host target genes. The mRNA of each one of this plurality of VGAM423 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM423 RNA, herein designated VGAM RNA, and which when bound by VGAM423 RNA causes inhibition of translation of respective one or more VGAM423

host target proteins.

[20174] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM423 gene, herein designated VGAM GENE, on one or more VGAM423 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[20175] It is yet further appreciated that a function of VGAM423 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM423 include diagnosis, prevention and treatment of viral infection by Canine Parvovirus. Specific

functions, and accordingly utilities, of VGAM423 correlate with, and may be deduced from, the identity of the host target genes which VGAM423 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20176] Nucleotide sequences of the VGAM423 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM423 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM423 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM423 are further described hereinbelow with reference to Table 1.

[20177] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM423 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM423 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20178] As mentioned hereinabove with reference to Fig. 1, a function of VGAM423 gene, herein designated VGAM is inhibition of expression of VGAM423 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM423 correlate with, and may be deduced from, the identity of the target genes which VGAM423 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20179] Component of Oligomeric Golgi Complex 6 (COG6, Accession XM\_053233) is a VGAM423 host target gene. COG6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COG6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COG6 BINDING SITE, designated SEQ ID:36067, to the nucleotide sequence of VGAM423 RNA, herein designated VGAM RNA, also designated SEQ ID:3134.

[20180] A function of VGAM423 is therefore inhibition of Component of Oligomeric Golgi Complex 6 (COG6, Accession XM\_053233), a gene which is critical for the structure and function of the Golgi apparatus. Accordingly, utilities of VGAM423 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COG6. The function of COG6 has been established by previous studies. Multiprotein complexes are key determinants of Golgi apparatus structure and its capacity for intracellular

transport and glycoprotein modification. Several complexes have been identified, including the Golgi transport complex (GTC), the LDLC complex, which is involved in glycosylation reactions, and the SEC34 complex, which is involved in vesicular transport. These 3 complexes are identical and have been termed the conserved oligomeric Golgi (COG) complex, which includes COG6 (Ungar et al., 2002). By SDS-PAGE analysis of bovine brain cytosol, Ungar et al. (2002) identified the 8 subunits of the COG complex. Immunofluorescence microscopy demonstrated that COG1 (LDLB; 606973) colocalizes with COG7 (OMIM Ref. No. 606978), as well as with COG3 (OMIM Ref. No. 606975) and COG5 (OMIM Ref. No. 606821), with a Golgi marker in a perinuclear distribution. Immunoprecipitation analysis showed that all COG subunits interact with COG2 (LDLC; 606974). Ungar et al. (2002) concluded that the COG complex is critical for the structure and function of the Golgi apparatus and can influence intracellular membrane trafficking.

[20181] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20182] Ungar, D.; Oka, T.; Brittle, E. E.; Vasile, E.; Lupashin, V. V.;

Chatterton, J. E.; Heuser, J. E.; Krieger, M.; Waters, M. G. : Characterization of a mammalian Golgi-localized protein complex, COG, that is required for normal Golgi morphology and function. J. Cell Biol. 157: 405–415, 2002. ; and

[20183] Hirosawa, M.; Nagase, T.; Ishikawa, K.; Kikuno, R.; Nomura, N.; Ohara, O. : Characterization of cDNA clones selected by the GeneMark analysis from size-fractionated cDNA libraries from.

[20184] Further studies establishing the function and utilities of COG6 are found in John Hopkins OMIM database record ID 606977, and in cited publications numbered 7480 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protocadherin 19 (PCDH19, Accession XM\_033173) is another VGAM423 host target gene. PCDH19 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDH19, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH19 BINDING SITE, designated SEQ ID:31860, to the nucleotide sequence of VGAM423 RNA, herein designated VGAM RNA, also designated SEQ ID:3134.

[20185] Another function of VGAM423 is therefore inhibition of Protocadherin 19 (PCDH19, Accession XM\_033173). Accordingly, utilities of VGAM423 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH19. LOC146108 (Accession XM\_085322) is another VGAM423 host target gene. LOC146108 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146108, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146108 BINDING SITE, designated SEQ ID:38064, to the nucleotide sequence of VGAM423 RNA, herein designated VGAM RNA, also designated SEQ ID:3134.

[20186] Another function of VGAM423 is therefore inhibition of LOC146108 (Accession XM\_085322). Accordingly, utilities of VGAM423 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146108. LOC151126 (Accession XM\_087103) is another VGAM423 host target gene. LOC151126 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151126, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151126 BINDING SITE, designated SEQ ID:39058, to the nucleotide sequence of VGAM423 RNA, herein designated VGAM RNA, also designated SEQ ID:3134.

[20187] Another function of VGAM423 is therefore inhibition of LOC151126 (Accession XM\_087103). Accordingly, utilities of VGAM423 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151126. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 424 (VGAM424) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20188] VGAM424 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM424 was detected is described hereinabove with reference to Figs. 1–8.

[20189] VGAM424 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabies Virus. VGAM424

host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20190] VGAM424 gene encodes a VGAM424 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM424 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM424 precursor RNA is designated SEQ ID:410, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:410 is located at position 5883 relative to the genome of Rabies Virus.

[20191] VGAM424 precursor RNA folds onto itself, forming VGAM424 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20192] An enzyme complex designated DICER COMPLEX, `dices` the VGAM424 folded precursor RNA into VGAM424 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM424 RNA is designated SEQ ID:3135, and is provided hereinbelow with reference to the sequence listing part.

[20193] VGAM424 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM424 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM424 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[20194] VGAM424 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM424 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM424 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM424 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM424 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[20195] The complementary binding of VGAM424 RNA, herein designated VGAM RNA, to host target binding sites on VGAM424 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM424 host target RNA into VGAM424 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[20196] It is appreciated that VGAM424 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM424 host target genes. The mRNA of each one of this plurality of VGAM424 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM424 RNA, herein designated VGAM RNA, and which when bound by VGAM424 RNA causes inhibition of translation of respective one or more VGAM424 host target proteins.

[20197] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM424 gene, herein designated VGAM GENE, on one or more VGAM424 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[20198] It is yet further appreciated that a function of VGAM424 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM424 include diagnosis, prevention and treatment of viral infection by Rabies Virus. Specific functions, and accordingly utilities, of VGAM424 correlate with, and may be deduced from, the identity of the host target genes which VGAM424 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20199] Nucleotide sequences of the VGAM424 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM424 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM424 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM424 are further described hereinbelow with reference to Table 1.

[20200] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM424 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM424 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20201] As mentioned hereinabove with reference to Fig. 1, a function of VGAM424 gene, herein designated VGAM is inhibition of expression of VGAM424 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM424 correlate with, and may be deduced from, the identity of the target genes which VGAM424 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20202] SUV39H2 (Accession NM\_024670) is a VGAM424 host target gene. SUV39H2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SUV39H2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SUV39H2 BINDING SITE, designated SEQ ID:23974, to the nucleotide sequence of VGAM424 RNA, herein designated VGAM RNA, also designated SEQ

ID:3135.

[20203] A function of VGAM424 is therefore inhibition of SUV39H2 (Accession NM\_024670), a gene which is involved in gene repression and the modification of position-effect-variation. Accordingly, utilities of VGAM424 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SUV39H2. The function of SUV39H2 has been established by previous studies. O'Carroll et al. (2000) isolated and characterized a murine gene, Suv39h2, that encodes an H3 histone (see OMIM Ref. No. 601128) methyltransferase (OMIM Ref. No. HMTase) with 59% identity to Suv39h1 (OMIM Ref. No. 300254). Although both Suv39h loci displayed overlapping expression profiles during mouse embryogenesis, Suv39h2 transcripts remained specifically expressed in adult testes. Immunolocalization of the Suv39h2 protein during spermatogenesis indicated enriched distribution at the heterochromatin from the leptotene to the round spermatid stage. Moreover, Suv39h2 specifically accumulated with chromatin of the sex chromosomes (XY body), which undergo transcriptional silencing during the first meiotic prophase. These data were consistent with redundant enzymatic roles for Suv39h1 and Suv39h2 during

mouse development and suggested an additional function of the Suv39h2 HMTase in organizing meiotic heterochromatin that may even impart an epigenetic imprint to the male germline. Animal model experiments lend further support to the function of SUV39H2. Peters et al. (2001) generated mice deficient for either Suv39h1 or Suv39h2. These animals displayed normal viability and fertility and did not exhibit apparent phenotypes. The authors subsequently intercrossed Suv39h1  $-/-$  and Suv39h2  $-/-$  mice to generate compound Suv39h mutants that were then used to derive Suv39h double-null mice (Suv39h1  $-/-$  and Suv39h2  $-/-$ ). These mice displayed severely impaired viability and chromosomal instabilities that were associated with an increased tumor risk and perturbed chromosome interactions during male meiosis. These data suggested a crucial role for pericentric H3 histone-lys9 methylation in protecting genome stability and defined the Suv39h HMTases as important epigenetic regulators for mammalian development.

[20204] It is appreciated that the abovementioned animal model for SUV39H2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

- [20205] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [20206] O'Carroll, D.; Scherthan, H.; Peters, A. H. F. M.; Opravil, S.; Haynes, A. R.; Laible, G.; Rea, S.; Schmid, M.; Lebersorger, A.; Jerratsch, M.; Sattler, L.; Mattei, M. G.; Denny, P.; Brown, S. D. M.; Schweizer, D.; Jenuwein, T. : Isolation and characterization of Suv39h2, a second histone H3 methyltransferase gene that displays testis-specific expression. *Molec. - [20208] Further studies establishing the function and utilities of SUV39H2 are found in John Hopkins OMIM database record ID 606503, and in cited publications numbered 610 and 9071 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ13340 (Accession NM\_057175) is another VGAM424 host target gene. FLJ13340 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13340, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13340 BINDING SITE, designated SEQ ID:27704, to the nucleotide sequence of VGAM424 RNA, herein designated VGAM RNA, also designated SEQ ID:3135.

[20209] Another function of VGAM424 is therefore inhibition of FLJ13340 (Accession NM\_057175). Accordingly, utilities of VGAM424 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13340. TBDN100 (Accession NM\_025085) is another VGAM424 host target gene. TBDN100 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TBDN100, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBDN100 BINDING SITE, designated SEQ ID:24693, to the nucleotide sequence of VGAM424 RNA, herein designated VGAM RNA, also designated SEQ ID:3135.

[20210] Another function of VGAM424 is therefore inhibition of TBDN100 (Accession NM\_025085). Accordingly, utilities of VGAM424 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with TBDN100. Yes-associated Protein 1, 65kDa (YAP1, Accession NM\_006106) is another VGAM424 host target gene. YAP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by YAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YAP1 BINDING SITE, designated SEQ ID:12749, to the nucleotide sequence of VGAM424 RNA, herein designated VGAM RNA, also designated SEQ ID:3135.

[20211] Another function of VGAM424 is therefore inhibition of Yes-associated Protein 1, 65kDa (YAP1, Accession NM\_006106). Accordingly, utilities of VGAM424 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YAP1. LOC143153 (Accession XM\_084440) is another VGAM424 host target gene. LOC143153 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC143153, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143153 BINDING SITE, desig-

nated SEQ ID:37577, to the nucleotide sequence of VGAM424 RNA, herein designated VGAM RNA, also designated SEQ ID:3135.

[20212] Another function of VGAM424 is therefore inhibition of LOC143153 (Accession XM\_084440). Accordingly, utilities of VGAM424 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143153. LOC143154 (Accession XM\_084441) is another VGAM424 host target gene. LOC143154 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143154, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143154 BINDING SITE, designated SEQ ID:37584, to the nucleotide sequence of VGAM424 RNA, herein designated VGAM RNA, also designated SEQ ID:3135.

[20213] Another function of VGAM424 is therefore inhibition of LOC143154 (Accession XM\_084441). Accordingly, utilities of VGAM424 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143154. LOC144571 (Accession XM\_096630) is another VGAM424 host target gene. LOC144571 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144571, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144571 BINDING SITE, designated SEQ ID:40440, to the nucleotide sequence of VGAM424 RNA, herein designated VGAM RNA, also designated SEQ ID:3135.

[20214] Another function of VGAM424 is therefore inhibition of LOC144571 (Accession XM\_096630). Accordingly, utilities of VGAM424 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144571. LOC146346 (Accession XM\_085430) is another VGAM424 host target gene. LOC146346 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146346, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146346 BINDING SITE, designated SEQ ID:38137, to the nucleotide sequence of VGAM424 RNA, herein designated VGAM RNA, also designated SEQ ID:3135.

[20215] Another function of VGAM424 is therefore inhibition of

LOC146346 (Accession XM\_085430). Accordingly, utilities of VGAM424 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146346. LOC219294 (Accession XM\_167566) is another VGAM424 host target gene. LOC219294 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219294 BINDING SITE, designated SEQ ID:44685, to the nucleotide sequence of VGAM424 RNA, herein designated VGAM RNA, also designated SEQ ID:3135.

[20216] Another function of VGAM424 is therefore inhibition of LOC219294 (Accession XM\_167566). Accordingly, utilities of VGAM424 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219294. LOC219295 (Accession XM\_167565) is another VGAM424 host target gene. LOC219295 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219295, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC219295 BINDING SITE, designated SEQ ID:44680, to the nucleotide sequence of VGAM424 RNA, herein designated VGAM RNA, also designated SEQ ID:3135.

[20217] Another function of VGAM424 is therefore inhibition of LOC219295 (Accession XM\_167565). Accordingly, utilities of VGAM424 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219295. LOC219790 (Accession XM\_166124) is another VGAM424 host target gene. LOC219790 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219790, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219790 BINDING SITE, designated SEQ ID:43904, to the nucleotide sequence of VGAM424 RNA, herein designated VGAM RNA, also designated SEQ ID:3135.

[20218] Another function of VGAM424 is therefore inhibition of LOC219790 (Accession XM\_166124). Accordingly, utilities of VGAM424 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219790. LOC221687 (Accession XM\_166423) is an-

other VGAM424 host target gene. LOC221687 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221687, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221687 BINDING SITE, designated SEQ ID:44303, to the nucleotide sequence of VGAM424 RNA, herein designated VGAM RNA, also designated SEQ ID:3135.

[20219] Another function of VGAM424 is therefore inhibition of LOC221687 (Accession XM\_166423). Accordingly, utilities of VGAM424 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221687. LOC83690 (Accession NM\_031461) is another VGAM424 host target gene. LOC83690 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC83690, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC83690 BINDING SITE, designated SEQ ID:25483, to the nucleotide sequence of VGAM424 RNA, herein designated VGAM RNA, also designated SEQ ID:3135.

[20220] Another function of VGAM424 is therefore inhibition of LOC83690 (Accession NM\_031461). Accordingly, utilities of VGAM424 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC83690. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 425 (VGAM425) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20221] VGAM425 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM425 was detected is described hereinabove with reference to Figs. 1–8.

[20222] VGAM425 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabies Virus. VGAM425 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20223] VGAM425 gene encodes a VGAM425 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM425 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM425 precursor RNA is designated SEQ ID:411, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:411 is located at position 8963 relative to the genome of Rabies Virus.

[20224] VGAM425 precursor RNA folds onto itself, forming VGAM425 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20225] An enzyme complex designated DICER COMPLEX, `dices` the VGAM425 folded precursor RNA into VGAM425 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide se-

quence of VGAM425 RNA is designated SEQ ID:3136, and is provided hereinbelow with reference to the sequence listing part.

[20226] VGAM425 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM425 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM425 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[20227] VGAM425 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM425 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM425 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM425 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM425 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[20228] The complementary binding of VGAM425 RNA, herein designated VGAM RNA, to host target binding sites on VGAM425 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM425 host target RNA into VGAM425 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20229] It is appreciated that VGAM425 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM425 host target genes. The mRNA of each one of this plurality of VGAM425 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM425 RNA, herein designated VGAM RNA, and which when bound by VGAM425 RNA causes inhibition of translation of respective one or more VGAM425 host target proteins.

[20230] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM425 gene, herein designated VGAM GENE, on one or more VGAM425 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[20231] It is yet further appreciated that a function of VGAM425 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM425 include diagnosis, prevention and treatment of viral infection by Rabies Virus. Specific functions, and accordingly utilities, of VGAM425 correlate with, and may be deduced from, the identity of the host target genes which VGAM425 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20232] Nucleotide sequences of the VGAM425 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM425 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM425 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM425 are further described hereinbelow with reference to Table 1.

[20233] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM425 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM425 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20234] As mentioned hereinabove with reference to Fig. 1, a function of VGAM425 gene, herein designated VGAM is inhibition of expression of VGAM425 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM425 correlate with, and may be deduced from, the identity of the target genes which VGAM425 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20235] Amyloid Beta (A4) Precursor Protein-binding, Family B, Member 2 (Fe65-like) (APBB2, Accession XM\_051782) is a VGAM425 host target gene. APBB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APBB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APBB2 BINDING SITE, designated SEQ ID:35879, to the nucleotide sequence of VGAM425 RNA, herein designated VGAM RNA, also designated SEQ ID:3136.

[20236] A function of VGAM425 is therefore inhibition of Amyloid Beta (A4) Precursor Protein-binding, Family B, Member 2 (Fe65-like) (APBB2, Accession XM\_051782), a gene which Interacts with beta-amyloid precursor protein and with

APLP2. Accordingly, utilities of VGAM425 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APBB2. The function of APBB2 has been established by previous studies. The cytoplasmic domain of the Alzheimer disease locus amyloid protein precursor (APP; 107640) binds 4 human phosphotyrosine-binding (PTB) proteins; see APBA1 (OMIM Ref. No. 602414). By use of a yeast 2-hybrid screening of a human brain cDNA library, McLoughlin and Miller (1996) identified 3 of these proteins: the human homolog of Fe65 (APBB1; 602709), an Fe65-like sequence (APBB2), and an X11-like sequence (APBA2; 602712). From a human fetal brain cDNA library, Guenette et al. (1996) also cloned APBB2 based on its interaction with the carboxy terminus of APP. They showed that the APBB2 protein interacts with another amyloid protein precursor, APLP2 (OMIM Ref. No. 104776), but not with APLP1 (OMIM Ref. No. 104775). The APBB2 gene encodes a 730-amino acid polypeptide that is 51% identical to rat Fe65. Northern blot analysis revealed that APBB2 has widespread expression in human tissues. By use of a radiation hybrid panel, Blanco et al. (1998) mapped the human APBB2 gene to chromosome 4, between the markers D4S405 (OMIM Ref. No. 4.6 cR) and D4S496 (10.1 cR).

[20237] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20238] Blanco, G.; Irving, N. G.; Brown, S. D. M.; Miller, C. C. J.; McLoughlin, D. M. : Mapping of the human and murine X11-like genes (APBA2 and Apba2), the murine Fe65 gene (Apbb1), and the human Fe65-like gene (APBB2): genes encoding phosphotyrosine-binding domain proteins that interact with the Alzheimer's disease amyloid precursor protein. Mammalian Genome 9: 473-475, 1998. ; and

[20239] Guenette, S. Y.; Chen, J.; Jondro, P. D.; Tanzi, R. E. : Association of a novel human FE65-like protein with the cytoplasmic domain of the beta-amyloid precursor protein. Proc. Nat. Acad.

[20240] Further studies establishing the function and utilities of APBB2 are found in John Hopkins OMIM database record ID 602710, and in cited publications numbered 101 and 1119 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Neuronal Cell Adhesion Molecule (NRCAM, Accession NM\_005010) is another VGAM425 host target gene. NRCAM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NRCAM, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRCAM BINDING SITE, designated SEQ ID:11451, to the nucleotide sequence of VGAM425 RNA, herein designated VGAM RNA, also designated SEQ ID:3136.

[20241] Another function of VGAM425 is therefore inhibition of Neuronal Cell Adhesion Molecule (NRCAM, Accession NM\_005010), a gene which functions as a cell surface protein and belongs to the immunoglobulin superfamily. Accordingly, utilities of VGAM425 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRCAM. The function of NRCAM and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM268. Protein Tyrosine Phosphatase, Non-receptor Type 18 (brain-derived) (PTPN18, Accession NM\_014369) is another VGAM425 host target gene. PTPN18 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTPN18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of PTPN18 BINDING SITE, designated SEQ ID:15703, to the nucleotide sequence of VGAM425 RNA, herein designated VGAM RNA, also designated SEQ ID:3136.

[20242] Another function of VGAM425 is therefore inhibition of Protein Tyrosine Phosphatase, Non-receptor Type 18 (brain-derived) (PTPN18, Accession NM\_014369). Accordingly, utilities of VGAM425 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTPN18. KIAA1598 (Accession NM\_018330) is another VGAM425 host target gene. KIAA1598 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1598, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1598 BINDING SITE, designated SEQ ID:20329, to the nucleotide sequence of VGAM425 RNA, herein designated VGAM RNA, also designated SEQ ID:3136.

[20243] Another function of VGAM425 is therefore inhibition of KIAA1598 (Accession NM\_018330). Accordingly, utilities of VGAM425 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1598. LOC196500 (Accession XM\_113734) is another VGAM425 host target gene. LOC196500 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196500, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196500 BINDING SITE, designated SEQ ID:42390, to the nucleotide sequence of VGAM425 RNA, herein designated VGAM RNA, also designated SEQ ID:3136.

[20244] Another function of VGAM425 is therefore inhibition of LOC196500 (Accession XM\_113734). Accordingly, utilities of VGAM425 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196500. LOC219855 (Accession XM\_166184) is another VGAM425 host target gene. LOC219855 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219855, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219855 BINDING SITE, designated SEQ ID:43996, to the nucleotide sequence of VGAM425 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3136.

[20245] Another function of VGAM425 is therefore inhibition of LOC219855 (Accession XM\_166184). Accordingly, utilities of VGAM425 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219855. LOC221814 (Accession XM\_168226) is another VGAM425 host target gene. LOC221814 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221814, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221814 BINDING SITE, designated SEQ ID:45092, to the nucleotide sequence of VGAM425 RNA, herein designated VGAM RNA, also designated SEQ ID:3136.

[20246] Another function of VGAM425 is therefore inhibition of LOC221814 (Accession XM\_168226). Accordingly, utilities of VGAM425 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221814. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 426 (VGAM426) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20247] VGAM426 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM426 was detected is described hereinabove with reference to Figs. 1–8.

[20248] VGAM426 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabies Virus. VGAM426 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20249] VGAM426 gene encodes a VGAM426 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM426 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM426 precursor RNA is designated SEQ ID:412, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:412 is located at position 5774 relative to the genome of Rabies Virus.

[20250] VGAM426 precursor RNA folds onto itself, forming VGAM426 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional  
`hairpin structure`. As is well known in the art, this  
`hairpin structure`, is typical of RNA encoded by miRNA  
genes, and is due to the fact that the nucleotide sequence  
of the first half of the RNA encoded by a miRNA gene is an  
accurate or partial inversed-reversed sequence of the nu-  
cleotide sequence of the second half thereof.

[20251] An enzyme complex designated DICER COMPLEX, `dices`  
the VGAM426 folded precursor RNA into VGAM426 RNA,  
herein designated VGAM RNA, a single stranded ~22 nt  
long RNA segment. As is known in the art, `dicing` of a  
hairpin structured RNA precursor product into a short  
~22nt RNA segment is catalyzed by an enzyme complex  
comprising an enzyme called Dicer together with other  
necessary proteins. A probable (over 46%) nucleotide se-  
quence of VGAM426 RNA is designated SEQ ID:3137, and  
is provided hereinbelow with reference to the sequence  
listing part.

[20252] VGAM426 host target gene, herein designated VGAM  
HOST TARGET GENE, encodes a corresponding messenger  
RNA, VGAM426 host target RNA, herein designated VGAM  
HOST TARGET RNA. VGAM426 host target RNA comprises  
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[20253] VGAM426 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM426 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM426 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM426 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM426 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[20254] The complementary binding of VGAM426 RNA, herein designated VGAM RNA, to host target binding sites on VGAM426 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM426 host target RNA into VGAM426 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20255] It is appreciated that VGAM426 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM426 host target genes. The mRNA of each one of this plurality of VGAM426 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM426 RNA, herein designated VGAM RNA, and which when bound by VGAM426 RNA causes inhibition of translation of respective one or more VGAM426 host target proteins.

[20256] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM426 gene, herein designated VGAM GENE, on one or more VGAM426 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[20257] It is yet further appreciated that a function of VGAM426 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM426 include diagnosis, prevention and treatment of viral infection by Rabies Virus. Specific functions, and accordingly utilities, of VGAM426 correlate with, and may be deduced from, the identity of the host target genes which VGAM426 binds and inhibits, and the function of these host target genes, as elaborated herein—

below.

- [20258] Nucleotide sequences of the VGAM426 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM426 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM426 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM426 are further described hereinbelow with reference to Table 1.
- [20259] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM426 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM426 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [20260] As mentioned hereinabove with reference to Fig. 1, a function of VGAM426 gene, herein designated VGAM is inhibition of expression of VGAM426 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM426 correlate with, and may be deduced from, the identity of the target genes which VGAM426 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20261] Calsequestrin 2 (cardiac muscle) (CASQ2, Accession NM\_001232) is a VGAM426 host target gene. CASQ2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CASQ2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CASQ2 BINDING SITE, designated SEQ ID:6904, to the nucleotide sequence of VGAM426 RNA, herein designated VGAM RNA, also designated SEQ ID:3137.

[20262] A function of VGAM426 is therefore inhibition of Calsequestrin 2 (cardiac muscle) (CASQ2, Accession NM\_001232). Accordingly, utilities of VGAM426 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASQ2. NIMA (never in mitosis gene a)-related Kinase 6 (NEK6, Accession NM\_014397) is another VGAM426 host target gene. NEK6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEK6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEK6 BINDING SITE, designated SEQ ID:15740, to the nu-

cleotide sequence of VGAM426 RNA, herein designated VGAM RNA, also designated SEQ ID:3137.

[20263] Another function of VGAM426 is therefore inhibition of NIMA (never in mitosis gene a)-related Kinase 6 (NEK6, Accession NM\_014397), a gene which regulates nuclear and cytoplasmic aspects of the mitotic cycle. Accordingly, utilities of VGAM426 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEK6. The function of NEK6 has been established by previous studies. The *Aspergillus nidulans* 'never in mitosis A' (NIMA) gene encodes a serine/threonine kinase that controls initiation of mitosis. NIMA-related kinases (NEKs) are a group of protein kinases that are homologous to NIMA. Evidence suggests that NEKs perform functions similar to those of NIMA. Li et al. (1999) reported the cloning of a human liver cDNA encoding NEK6. Kimura and Okano (2001) determined that NEK6 and NEK7 (OMIM Ref. No. 606848) share 77% amino acid identity. By Northern blot analysis, Li et al. (1999) detected 1.6-, 2.6-, and 9.5-kb NEK6 transcripts. The 1.6-kb transcript was expressed at highest levels in liver and placenta. By RT-PCR, Kimura and Okano (2001) found expression of NEK6 in all tissues examined.

[20264] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20265] Kimura, M.; Okano, Y. : Identification and assignment of the human NIMA-related protein kinase 7 gene (NEK7) to human chromosome 1q31.3. Cytogenet. Cell Genet. 94: 33-38, 2001. ; and

[20266] Li, M. Z.; Yu, L.; Liu, Q.; Chu, J. Y.; Zhao, S. Y. : Assignment of NEK6, a NIMA-related gene, to human chromosome 9q33.3-q34.11 by radiation hybrid mapping. Cytogenet. Cell Genet. 87:.

[20267] Further studies establishing the function and utilities of NEK6 are found in John Hopkins OMIM database record ID 604884, and in cited publications numbered 6947-6948 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein Kinase, CGMP-dependent, Type II (PRKG2, Accession NM\_006259) is another VGAM426 host target gene. PRKG2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRKG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

PRKG2 BINDING SITE, designated SEQ ID:12942, to the nucleotide sequence of VGAM426 RNA, herein designated VGAM RNA, also designated SEQ ID:3137.

[20268] Another function of VGAM426 is therefore inhibition of Protein Kinase, CGMP-dependent, Type II (PRKG2, Accession NM\_006259), a gene which regulate a great variety of functions, including smooth muscle relaxation, neuronal excitability, and epithelial electrolyte transport. Accordingly, utilities of VGAM426 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKG2. The function of PRKG2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM16. Winged-helix Nude (WHN, Accession NM\_003593) is another VGAM426 host target gene. WHN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WHN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WHN BINDING SITE, designated SEQ ID:9648, to the nucleotide sequence of VGAM426 RNA, herein designated VGAM RNA, also designated SEQ ID:3137.

[20269] Another function of VGAM426 is therefore inhibition of Winged-helix Nude (WHN, Accession NM\_003593), a gene which plays a role in transcriptional regulation. Accordingly, utilities of VGAM426 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WHN. The function of WHN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM403. Allantoicase (ALLC, Accession NM\_018436) is another VGAM426 host target gene. ALLC BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ALLC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALLC BINDING SITE, designated SEQ ID:20497, to the nucleotide sequence of VGAM426 RNA, herein designated VGAM RNA, also designated SEQ ID:3137.

[20270] Another function of VGAM426 is therefore inhibition of Allantoicase (ALLC, Accession NM\_018436). Accordingly, utilities of VGAM426 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALLC. E74-like Factor 1 (ets domain transcription

factor) (ELF1, Accession XM\_049376) is another VGAM426 host target gene. ELF1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ELF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELF1 BINDING SITE, designated SEQ ID:35402, to the nucleotide sequence of VGAM426 RNA, herein designated VGAM RNA, also designated SEQ ID:3137.

[20271] Another function of VGAM426 is therefore inhibition of E74-like Factor 1 (ets domain transcription factor) (ELF1, Accession XM\_049376). Accordingly, utilities of VGAM426 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ELF1. Epsin 3 (EPN3, Accession NM\_017957) is another VGAM426 host target gene. EPN3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by EPN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPN3 BINDING SITE, designated SEQ ID:19668, to the nucleotide sequence of VGAM426 RNA,

herein designated VGAM RNA, also designated SEQ ID:3137.

[20272] Another function of VGAM426 is therefore inhibition of Epsin 3 (EPN3, Accession NM\_017957). Accordingly, utilities of VGAM426 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPN3. FLJ11806 (Accession NM\_024824) is another VGAM426 host target gene. FLJ11806 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ11806, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11806 BINDING SITE, designated SEQ ID:24216, to the nucleotide sequence of VGAM426 RNA, herein designated VGAM RNA, also designated SEQ ID:3137.

[20273] Another function of VGAM426 is therefore inhibition of FLJ11806 (Accession NM\_024824). Accordingly, utilities of VGAM426 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11806. FLJ20294 (Accession NM\_017749) is another VGAM426 host target gene. FLJ20294 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by FLJ20294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20294 BINDING SITE, designated SEQ ID:19343, to the nucleotide sequence of VGAM426 RNA, herein designated VGAM RNA, also designated SEQ ID:3137.

[20274] Another function of VGAM426 is therefore inhibition of FLJ20294 (Accession NM\_017749). Accordingly, utilities of VGAM426 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20294. FLJ23462 (Accession NM\_024843) is another VGAM426 host target gene. FLJ23462 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23462, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23462 BINDING SITE, designated SEQ ID:24264, to the nucleotide sequence of VGAM426 RNA, herein designated VGAM RNA, also designated SEQ ID:3137.

[20275] Another function of VGAM426 is therefore inhibition of FLJ23462 (Accession NM\_024843). Accordingly, utilities of

VGAM426 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23462. KIAA1202 (Accession XM\_050478) is another VGAM426 host target gene. KIAA1202 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1202, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1202 BINDING SITE, designated SEQ ID:35639, to the nucleotide sequence of VGAM426 RNA, herein designated VGAM RNA, also designated SEQ ID:3137.

[20276] Another function of VGAM426 is therefore inhibition of KIAA1202 (Accession XM\_050478). Accordingly, utilities of VGAM426 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1202. MGC2452 (Accession NM\_032644) is another VGAM426 host target gene. MGC2452 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC2452, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2452

BINDING SITE, designated SEQ ID:26374, to the nucleotide sequence of VGAM426 RNA, herein designated VGAM RNA, also designated SEQ ID:3137.

[20277] Another function of VGAM426 is therefore inhibition of MGC2452 (Accession NM\_032644). Accordingly, utilities of VGAM426 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2452. P115 (Accession NM\_003715) is another VGAM426 host target gene. P115 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P115, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P115 BINDING SITE, designated SEQ ID:9812, to the nucleotide sequence of VGAM426 RNA, herein designated VGAM RNA, also designated SEQ ID:3137.

[20278] Another function of VGAM426 is therefore inhibition of P115 (Accession NM\_003715). Accordingly, utilities of VGAM426 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P115. Signal Sequence Receptor, Alpha (translocon-associated protein alpha) (SSR1, Accession NM\_003144) is another

VGAM426 host target gene. SSR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SSR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSR1 BINDING SITE, designated SEQ ID:9115, to the nucleotide sequence of VGAM426 RNA, herein designated VGAM RNA, also designated SEQ ID:3137.

[20279] Another function of VGAM426 is therefore inhibition of Signal Sequence Receptor, Alpha (translocon-associated protein alpha) (SSR1, Accession NM\_003144). Accordingly, utilities of VGAM426 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSR1. Testis Specific, 14 (TSGA14, Accession NM\_018718) is another VGAM426 host target gene. TSGA14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TSGA14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSGA14 BINDING SITE, designated SEQ ID:20795, to the nucleotide sequence of VGAM426 RNA,

herein designated VGAM RNA, also designated SEQ ID:3137.

[20280] Another function of VGAM426 is therefore inhibition of Testis Specific, 14 (TSGA14, Accession NM\_018718). Accordingly, utilities of VGAM426 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSGA14. LOC146337 (Accession XM\_096982) is another VGAM426 host target gene. LOC146337 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146337 BINDING SITE, designated SEQ ID:40692, to the nucleotide sequence of VGAM426 RNA, herein designated VGAM RNA, also designated SEQ ID:3137.

[20281] Another function of VGAM426 is therefore inhibition of LOC146337 (Accession XM\_096982). Accordingly, utilities of VGAM426 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146337. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 427 (VGAM427) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20282] VGAM427 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM427 was detected is described hereinabove with reference to Figs. 1–8.

[20283] VGAM427 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabies Virus. VGAM427 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20284] VGAM427 gene encodes a VGAM427 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM427 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM427 precursor RNA is designated SEQ ID:413, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:413 is located at position 5539 relative to the genome of Rabies Virus.

[20285] VGAM427 precursor RNA folds onto itself, forming VGAM427 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20286] An enzyme complex designated DICER COMPLEX, `dices` the VGAM427 folded precursor RNA into VGAM427 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM427 RNA is designated SEQ ID:3138, and is provided hereinbelow with reference to the sequence listing part.

[20287] VGAM427 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM427 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM427 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[20288] VGAM427 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM427 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM427 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM427 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM427 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[20289] The complementary binding of VGAM427 RNA, herein designated VGAM RNA, to host target binding sites on VGAM427 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM427 host target RNA into VGAM427 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20290] It is appreciated that VGAM427 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM427 host target genes. The mRNA of each one of this plurality of VGAM427 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM427 RNA, herein designated VGAM RNA, and which when bound by VGAM427 RNA causes inhibition of translation of respective one or more VGAM427 host target proteins.

[20291] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM427 gene, herein designated VGAM GENE, on one or more VGAM427 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[20292] It is yet further appreciated that a function of VGAM427 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM427 include diagnosis, prevention and treatment of viral infection by Rabies Virus. Specific functions, and accordingly utilities, of VGAM427 correlate with, and may be deduced from, the identity of the host

target genes which VGAM427 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20293] Nucleotide sequences of the VGAM427 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM427 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM427 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM427 are further described hereinbelow with reference to Table 1.

[20294] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM427 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM427 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20295] As mentioned hereinabove with reference to Fig. 1, a function of VGAM427 gene, herein designated VGAM is inhibition of expression of VGAM427 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM427 correlate with, and may be deduced from, the identity of the target genes which VGAM427

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20296] Aldehyde Dehydrogenase 3 Family, Member A2

(ALDH3A2, Accession XM\_045060) is a VGAM427 host target gene. ALDH3A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ALDH3A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALDH3A2 BINDING SITE, designated SEQ ID:34339, to the nucleotide sequence of VGAM427 RNA, herein designated VGAM RNA, also designated SEQ ID:3138.

[20297] A function of VGAM427 is therefore inhibition of Aldehyde Dehydrogenase 3 Family, Member A2 (ALDH3A2, Accession XM\_045060). Accordingly, utilities of VGAM427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALDH3A2. Calnexin (CANX, Accession XM\_113469) is another VGAM427 host target gene. CANX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CANX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of CANX BINDING SITE, designated SEQ ID:42275, to the nucleotide sequence of VGAM427 RNA, herein designated VGAM RNA, also designated SEQ ID:3138.

[20298] Another function of VGAM427 is therefore inhibition of Calnexin (CANX, Accession XM\_113469), a gene which may function as a chaperone in the endoplasmic reticulum, involved in the secretion of proteins from the ER to the outer cellular membrane. Accordingly, utilities of VGAM427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CANX. The function of CANX and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM116. Integrin, Beta 1 (fibronectin receptor, beta polypeptide, antigen CD29 includes MDF2, MSK12) (ITGB1, Accession NM\_002211) is another VGAM427 host target gene. ITGB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITGB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of ITGB1 BINDING SITE, designated SEQ ID:7976, to the nucleotide sequence of VGAM427 RNA, herein designated VGAM RNA, also designated SEQ ID:3138.

[20299] Another function of VGAM427 is therefore inhibition of Integrin, Beta 1 (fibronectin receptor, beta polypeptide, antigen CD29 includes MDF2, MSK12) (ITGB1, Accession NM\_002211), a gene which acts as a fibronectin receptor. Accordingly, utilities of VGAM427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGB1. The function of ITGB1 has been established by previous studies. See 135620. The fibronectin receptors contain a beta subunit that appears to be analogous to band 3 of integrin (Pytela et al., 1986; Johansson et al., 1987). Hynes (1987) proposed that there are 3 subfamilies within the family of human adhesion protein receptor heterodimers based upon the number of different beta subunits. The other 2 subfamilies are the platelet and the endothelial cell heterodimers, which use GP IIIa (OMIM Ref. No. 173470), and the leukocyte heterodimers, which contain a 95,000 Da beta subunit that is homologous to GP IIIa but is clearly a different protein (OMIM Ref. No. 116920). Zhang et al. (1988) examined human-mouse hybrid cells by indirect immunofluores-

cence with a monoclonal antibody that recognizes the beta subunit of the human fibronectin receptor. Cells that expressed the antigen at their surface were sorted by FACS and karyotyped. The findings, strengthened by isozyme analysis of markers for chromosomes 9 and 10, suggested that the beta subunit is located on 10p. By examining the cation dependence of JAM2 (OMIM Ref. No. 606870) adhesion to a T-cell line, Cunningham et al. (2002) identified a manganese-enhanced binding component indicative of integrin involvement. Using neutralizing integrin antibodies, they showed that the manganese-enhanced binding component was due to an interaction between JAM2 and ITGA4/ITGB1. However, the interaction was only enabled following prior adhesion of JAM2 to JAM3 (OMIM Ref. No. 606871). Cunningham et al. (2002) determined that the engagement of all these ligands occurs through a nonacidic residue in an Ig-like fold of JAM2. An inhibitor of ITGA4, TBC772, attenuated the manganese-enhanced binding. Animal model experiments lend further support to the function of ITGB1. Graus-Porta et al. (2001) used Cre/Lox-mediated recombination to generate mice with an *Itgb1*-null allele in the precursors of neurons and glia, thereby inactivating all beta-1-class

integrin receptors in the nervous system. The mice died prematurely after birth with severe brain malformations. Using histologic sections of brains at varying ages, Graus-Porta et al. (2001) observed that cortical hemispheres and cerebellar folia fuse, and cortical laminae are perturbed in the knockout mice. These defects result from disorganization of the cortical marginal zone, where Graus-Porta et al. (2001) hypothesized that beta-1-class integrins regulate glial endfeet anchorage, meningeal basement membrane remodeling, and formation of the Cajal-Retzius cell layer. Graus-Porta et al. (2001) concluded that beta-1-class integrins are not essential for neuron-glia interactions and neuronal migration during corticogenesis. They noted that the phenotype of the beta-1-deficient mice resembles pathologic changes observed in human cortical dysplasias, suggesting that defective integrin-mediated signal transduction contributes to the development of some of these diseases

[20300] It is appreciated that the abovementioned animal model for ITGB1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[20301] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [20302] Zhang, Y.; Saison, M.; Spaepen, M.; De Strooper, B.; Van Leuven, F.; David, G.; Van den Berghe, H.; Cassiman, J.-J. : Mapping of human fibronectin receptor beta subunit gene to chromosome 10. *Somat. Cell Molec. Genet.* 14: 99–104, 1988. ; and
- [20303] Graus–Porta, D.; Blaess, S.; Senften, M.; Littlewood–Evans, A.; Damsky, C.; Huang, Z.; Orban, P.; Klein, R.; Schittny, J. C.; Muller, U. : Beta–1–class integrins regulate the development.
- [20304] Further studies establishing the function and utilities of ITGB1 are found in John Hopkins OMIM database record ID 135630, and in cited publications numbered 3340–335 and 3463 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Phosphatidylinositol–4–phosphate 5–kinase, Type I, Alpha (PIP5K1A, Accession NM\_003557) is another VGAM427 host target gene. PIP5K1A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PIP5K1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com–

plementarity of the nucleotide sequences of PIP5K1A BINDING SITE, designated SEQ ID:9601, to the nucleotide sequence of VGAM427 RNA, herein designated VGAM RNA, also designated SEQ ID:3138.

[20305] Another function of VGAM427 is therefore inhibition of Phosphatidylinositol-4-phosphate 5-kinase, Type I, Alpha (PIP5K1A, Accession NM\_003557), a gene which is responsible for the synthesis of PtdIns(4,5)P<sub>2</sub>. Accordingly, utilities of VGAM427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIP5K1A. The function of PIP5K1A has been established by previous studies. By searching sequence databases with peptide sequences obtained from the 68-kD type I PIP5K purified from bovine erythrocytes, Loijens and Anderson (1996) identified a human EST encoding PIP5K1A, which they called PIP5KI-alpha. They screened a human fetal brain cDNA library and isolated full-length PIP5K1A cDNAs. The deduced 549-amino acid protein has the conserved kinase homology domain of PIP5K family members. Within this domain, PIP5K1A shows 83% and 35% amino acid identity with PIP5K1B (OMIM Ref. No. 602745) and PIP5K2A (OMIM Ref. No. 603140), respectively. Overall, the PIP5K1A and PIP5K1B proteins are

64% identical. Recombinant PIP5K1A expressed in bacteria had a molecular mass of approximately 66.3 kD by Western blot analysis. The authors isolated additional PIP5K1A cDNAs which they suggested represent splicing isoforms. Northern blot analysis detected a major 4.2-kb PIP5K1A transcript which had a wide tissue distribution. Using deletion mutant analysis, Ishihara et al. (1998) identified an approximately 380-amino acid minimal core sequence of mouse Pip5k1a that was sufficient for phosphatidylinositol 4-phosphate kinase activity. Overexpression of mouse Pip5k1a in COS7 cells induced an increase in short actin fibers and a decrease in actin stress fibers.

[20306] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20307] Loijens, J. C.; Anderson, R. A. : Type I phosphatidylinositol-4-phosphate 5-kinases are distinct members of this novel lipid kinase family. *J. Biol. Chem.* 271: 32937-32943, 1996. ; and

[20308] Xie, Y.; Zhu, L.; Zhao, G. : Assignment of type I phosphatidylinositol-4-phosphate 5-kinase (PIP5K1A) to human chromosome bands 1q22-q24 by in situ hybridization. *Cytogenet. Cell Genet.*

[20309] Further studies establishing the function and utilities of PIP5K1A are found in John Hopkins OMIM database record ID 603275, and in cited publications numbered 8741–5068 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Usher Syndrome 3A (USH3A, Accession NM\_052995) is another VGAM427 host target gene. USH3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by USH3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USH3A BINDING SITE, designated SEQ ID:27559, to the nucleotide sequence of VGAM427 RNA, herein designated VGAM RNA, also designated SEQ ID:3138.

[20310] Another function of VGAM427 is therefore inhibition of Usher Syndrome 3A (USH3A, Accession NM\_052995). Accordingly, utilities of VGAM427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USH3A. Zinc Finger Protein 189 (ZNF189, Accession NM\_003452) is another VGAM427 host target gene. ZNF189 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

ZNF189, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF189 BINDING SITE, designated SEQ ID:9503, to the nucleotide sequence of VGAM427 RNA, herein designated VGAM RNA, also designated SEQ ID:3138.

[20311] Another function of VGAM427 is therefore inhibition of Zinc Finger Protein 189 (ZNF189, Accession NM\_003452). Accordingly, utilities of VGAM427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF189. FLJ10546 (Accession XM\_002989) is another VGAM427 host target gene. FLJ10546 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ10546, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10546 BINDING SITE, designated SEQ ID:29911, to the nucleotide sequence of VGAM427 RNA, herein designated VGAM RNA, also designated SEQ ID:3138.

[20312] Another function of VGAM427 is therefore inhibition of

FLJ10546 (Accession XM\_002989). Accordingly, utilities of VGAM427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10546. FLJ23563 (Accession XM\_041701) is another VGAM427 host target gene. FLJ23563 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23563, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23563 BINDING SITE, designated SEQ ID:33558, to the nucleotide sequence of VGAM427 RNA, herein designated VGAM RNA, also designated SEQ ID:3138.

[20313] Another function of VGAM427 is therefore inhibition of FLJ23563 (Accession XM\_041701). Accordingly, utilities of VGAM427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23563. LOC115294 (Accession XM\_054302) is another VGAM427 host target gene. LOC115294 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of LOC115294 BINDING SITE, designated SEQ ID:36142, to the nucleotide sequence of VGAM427 RNA, herein designated VGAM RNA, also designated SEQ ID:3138.

[20314] Another function of VGAM427 is therefore inhibition of LOC115294 (Accession XM\_054302). Accordingly, utilities of VGAM427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115294. LOC150606 (Accession XM\_097928) is another VGAM427 host target gene. LOC150606 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150606, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150606 BINDING SITE, designated SEQ ID:41233, to the nucleotide sequence of VGAM427 RNA, herein designated VGAM RNA, also designated SEQ ID:3138.

[20315] Another function of VGAM427 is therefore inhibition of LOC150606 (Accession XM\_097928). Accordingly, utilities of VGAM427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150606. LOC206426 (Accession XM\_116505) is an-

other VGAM427 host target gene. LOC206426 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC206426, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC206426 BINDING SITE, designated SEQ ID:43113, to the nucleotide sequence of VGAM427 RNA, herein designated VGAM RNA, also designated SEQ ID:3138.

[20316] Another function of VGAM427 is therefore inhibition of LOC206426 (Accession XM\_116505). Accordingly, utilities of VGAM427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC206426. LOC55901 (Accession NM\_018676) is another VGAM427 host target gene. LOC55901 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC55901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC55901 BINDING SITE, designated SEQ ID:20749, to the nucleotide sequence of VGAM427 RNA, herein designated VGAM RNA, also designated SEQ ID:3138.

[20317] Another function of VGAM427 is therefore inhibition of LOC55901 (Accession NM\_018676). Accordingly, utilities of VGAM427 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC55901. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 428 (VGAM428) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20318] VGAM428 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM428 was detected is described hereinabove with reference to Figs. 1–8.

[20319] VGAM428 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabies Virus. VGAM428 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20320] VGAM428 gene encodes a VGAM428 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM428 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM428 precursor RNA is designated SEQ ID:414, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:414 is located at position 6617 relative to the genome of Rabies Virus.

[20321] VGAM428 precursor RNA folds onto itself, forming VGAM428 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20322] An enzyme complex designated DICER COMPLEX, `dices` the VGAM428 folded precursor RNA into VGAM428 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 58%) nucleotide se-

quence of VGAM428 RNA is designated SEQ ID:3139, and is provided hereinbelow with reference to the sequence listing part.

[20323] VGAM428 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM428 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM428 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[20324] VGAM428 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM428 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM428 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM428 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM428 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[20325] The complementary binding of VGAM428 RNA, herein designated VGAM RNA, to host target binding sites on VGAM428 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM428 host target RNA into VGAM428 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20326] It is appreciated that VGAM428 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM428 host target genes. The mRNA of each one of this plurality of VGAM428 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM428 RNA, herein designated VGAM RNA, and which when bound by VGAM428 RNA causes inhibition of translation of respective one or more VGAM428 host target proteins.

[20327] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM428 gene, herein designated VGAM GENE, on one or more VGAM428 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[20328] It is yet further appreciated that a function of VGAM428 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM428 include diagnosis, prevention and treatment of viral infection by Rabies Virus. Specific functions, and accordingly utilities, of VGAM428 correlate with, and may be deduced from, the identity of the host target genes which VGAM428 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20329] Nucleotide sequences of the VGAM428 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM428 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM428 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM428 are further described hereinbelow with reference to Table 1.

[20330] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM428 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM428 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20331] As mentioned hereinabove with reference to Fig. 1, a function of VGAM428 gene, herein designated VGAM is inhibition of expression of VGAM428 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM428 correlate with, and may be deduced from, the identity of the target genes which VGAM428 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20332] Paired Mesoderm Homeo Box 1 (PMX1, Accession NM\_006902) is a VGAM428 host target gene. PMX1 BINDING SITE1 and PMX1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PMX1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PMX1 BINDING SITE1 and PMX1 BINDING SITE2, designated SEQ ID:13782 and SEQ ID:22917 respectively, to the nucleotide sequence of VGAM428 RNA, herein designated VGAM RNA, also designated SEQ ID:3139.

[20333] A function of VGAM428 is therefore inhibition of Paired Mesoderm Homeo Box 1 (PMX1, Accession NM\_006902), a gene which acts as a transcriptional regulator of muscle

creatine kinase. Accordingly, utilities of VGAM428 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMX1. The function of PMX1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM381. DIS3 (Accession NM\_014953) is another VGAM428 host target gene. DIS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DIS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DIS3 BINDING SITE, designated SEQ ID:17299, to the nucleotide sequence of VGAM428 RNA, herein designated VGAM RNA, also designated SEQ ID:3139.

[20334] Another function of VGAM428 is therefore inhibition of DIS3 (Accession NM\_014953). Accordingly, utilities of VGAM428 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIS3. FLJ22329 (Accession NM\_024656) is another VGAM428 host target gene. FLJ22329 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22329, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22329 BINDING SITE, designated SEQ ID:23957, to the nucleotide sequence of VGAM428 RNA, herein designated VGAM RNA, also designated SEQ ID:3139.

[20335] Another function of VGAM428 is therefore inhibition of FLJ22329 (Accession NM\_024656). Accordingly, utilities of VGAM428 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22329. LEC3 (Accession NM\_015236) is another VGAM428 host target gene. LEC3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LEC3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LEC3 BINDING SITE, designated SEQ ID:17571, to the nucleotide sequence of VGAM428 RNA, herein designated VGAM RNA, also designated SEQ ID:3139.

[20336] Another function of VGAM428 is therefore inhibition of LEC3 (Accession NM\_015236). Accordingly, utilities of VGAM428 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with LEC3.

SP192 (Accession NM\_021639) is another VGAM428 host target gene. SP192 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by SP192, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SP192 BINDING SITE, designated SEQ ID:22298, to the nucleotide sequence of VGAM428 RNA, herein designated VGAM RNA, also designated SEQ ID:3139.

[20337] Another function of VGAM428 is therefore inhibition of SP192 (Accession NM\_021639). Accordingly, utilities of VGAM428 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SP192. LOC144667 (Accession XM\_096648) is another VGAM428 host target gene. LOC144667 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144667, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144667 BINDING SITE, designated SEQ ID:40451, to the nucleotide se-

quence of VGAM428 RNA, herein designated VGAM RNA, also designated SEQ ID:3139.

[20338] Another function of VGAM428 is therefore inhibition of LOC144667 (Accession XM\_096648). Accordingly, utilities of VGAM428 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144667. LOC151996 (Accession XM\_098151) is another VGAM428 host target gene. LOC151996 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151996, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151996 BINDING SITE, designated SEQ ID:41416, to the nucleotide sequence of VGAM428 RNA, herein designated VGAM RNA, also designated SEQ ID:3139.

[20339] Another function of VGAM428 is therefore inhibition of LOC151996 (Accession XM\_098151). Accordingly, utilities of VGAM428 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151996. LOC256113 (Accession XM\_172989) is another VGAM428 host target gene. LOC256113 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC256113, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256113 BINDING SITE, designated SEQ ID:46260, to the nucleotide sequence of VGAM428 RNA, herein designated VGAM RNA, also designated SEQ ID:3139.

[20340] Another function of VGAM428 is therefore inhibition of LOC256113 (Accession XM\_172989). Accordingly, utilities of VGAM428 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256113. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 429 (VGAM429) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20341] VGAM429 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM429 was detected is described hereinabove with reference to Figs. 1–8.

[20342] VGAM429 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Rabbit Hemorrhagic Disease Virus. VGAM429 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20343] VGAM429 gene encodes a VGAM429 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM429 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM429 precursor RNA is designated SEQ ID:415, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:415 is located at position 4010 relative to the genome of Rabbit Hemorrhagic Disease Virus.

[20344] VGAM429 precursor RNA folds onto itself, forming VGAM429 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20345] An enzyme complex designated DICER COMPLEX, `dices` the VGAM429 folded precursor RNA into VGAM429 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM429 RNA is designated SEQ ID:3140, and is provided hereinbelow with reference to the sequence listing part.

[20346] VGAM429 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM429 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM429 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[20347] VGAM429 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM429 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM429 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM429 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM429 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[20348] The complementary binding of VGAM429 RNA, herein designated VGAM RNA, to host target binding sites on VGAM429 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM429 host tar-

get RNA into VGAM429 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20349] It is appreciated that VGAM429 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM429 host target genes. The mRNA of each one of this plurality of VGAM429 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM429 RNA, herein designated VGAM RNA, and which when bound by VGAM429 RNA causes inhibition of translation of respective one or more VGAM429 host target proteins.

[20350] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM429 gene, herein designated VGAM GENE, on one or more VGAM429 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[20351] It is yet further appreciated that a function of VGAM429 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM429 include diagnosis, prevention and treatment of viral infection by Rabbit Hemorrhagic Disease Virus. Specific functions, and accordingly utilities, of VGAM429 correlate with, and may be deduced from, the identity of the host target genes which VGAM429 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20352] Nucleotide sequences of the VGAM429 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM429 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM429 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM429 are further

described hereinbelow with reference to Table 1.

[20353] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM429 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM429 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20354] As mentioned hereinabove with reference to Fig. 1, a function of VGAM429 gene, herein designated VGAM is inhibition of expression of VGAM429 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM429 correlate with, and may be deduced from, the identity of the target genes which VGAM429 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20355] Angiopoietin 1 (ANGPT1, Accession NM\_001146) is a VGAM429 host target gene. ANGPT1 BINDING SITE1 and ANGPT1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ANGPT1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of ANGPT1 BINDING SITE1 and ANGPT1 BINDING SITE2, designated SEQ ID:6815 and SEQ ID:29290 respectively, to the nucleotide sequence of VGAM429 RNA, herein designated VGAM RNA, also designated SEQ ID:3140.

[20356] A function of VGAM429 is therefore inhibition of Angiopoietin 1 (ANGPT1, Accession NM\_001146), a gene which binds and activates tie2 receptor by inducing its tyrosine phosphorylation. Accordingly, utilities of VGAM429 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANGPT1. The function of ANGPT1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM291. Retinoblastoma Binding Protein 9 (RBBP9, Accession XM\_046553) is another VGAM429 host target gene. RBBP9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RBBP9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBBP9 BINDING SITE, designated SEQ ID:34743, to the nucleotide sequence of VGAM429 RNA,

herein designated VGAM RNA, also designated SEQ ID:3140.

[20357] Another function of VGAM429 is therefore inhibition of Retinoblastoma Binding Protein 9 (RBBP9, Accession XM\_046553). Accordingly, utilities of VGAM429 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBBP9. Ubiquitin Specific Protease 11 (USP11, Accession NM\_004651) is another VGAM429 host target gene. USP11 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by USP11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USP11 BINDING SITE, designated SEQ ID:11021, to the nucleotide sequence of VGAM429 RNA, herein designated VGAM RNA, also designated SEQ ID:3140.

[20358] Another function of VGAM429 is therefore inhibition of Ubiquitin Specific Protease 11 (USP11, Accession NM\_004651), a gene which removes ubiquitin from ubiquitin-conjugated proteins. Accordingly, utilities of VGAM429 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USP11.

The function of USP11 has been established by previous studies. Swanson et al. (1996) used a differential hybridization screen to isolate a novel cDNA from a human retina library. The cDNA encodes a protein of 690 amino acids and has strong homology to the proteins encoded by a variety of ubiquitin hydrolases (p values ranging between  $2.4e-265$  and  $1.4e-13$ ). Swanson et al. (1996) reviewed the role of ubiquitination in protein degradation and presented evidence that disturbances in protein processing and turnover can lead to retinal degeneration. They noted that there are at least 4 X-linked retinal diseases that map to a region within or overlapping the UHX1 interval. They cited evidence indicating that ubiquitin hydrolases play a role in oncogenesis (oncogenes and tumor suppressor gene products are degraded in ubiquitin-dependent pathways) and that the region of loss of heterozygosity in ovarian cancer lies within the mapping interval defined for UHX1. Swanson et al. (1996) mapped the structural gene encoding this cDNA, which they designated UHX1, to Xp21.2-p11.2 by somatic cell hybridization. Stoddart et al. (1999) mapped the UHX1 gene to Xp11.3 by inclusion within a YAC contig

[20359] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[20360] Swanson, D. A.; Freund, C. L.; Ploder, L.; McInnes, R. R.; Valle, D. : A ubiquitin C-terminal hydrolase gene on the proximal short arm of the X chromosome: implications for X-linked retinal disorders. Hum. Molec. Genet. 5:

533-538, 1996. ; and

[20361] Stoddart, K. L.; Jermak, C.; Nagaraja, R.; Schlessinger, D.; Bech-Hansen, N. T. : Physical map covering a 2 Mb region in human Xp11.3 distal to DX6849. Gene 227: 111-116, 1999.

[20362] Further studies establishing the function and utilities of USP11 are found in John Hopkins OMIM database record ID 300050, and in cited publications numbered 8997-8998 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZP564O0463 (Accession NM\_014156) is another VGAM429 host target gene. DKFZP564O0463 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564O0463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of DKFZP564O0463 BINDING SITE, designated SEQ ID:15444, to the nucleotide sequence of VGAM429 RNA, herein designated VGAM RNA, also designated SEQ ID:3140.

[20363] Another function of VGAM429 is therefore inhibition of DKFZP564O0463 (Accession NM\_014156). Accordingly, utilities of VGAM429 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564O0463. E74-like Factor 4 (ets domain transcription factor) (ELF4, Accession NM\_001421) is another VGAM429 host target gene. ELF4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ELF4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ELF4 BINDING SITE, designated SEQ ID:7125, to the nucleotide sequence of VGAM429 RNA, herein designated VGAM RNA, also designated SEQ ID:3140.

[20364] Another function of VGAM429 is therefore inhibition of E74-like Factor 4 (ets domain transcription factor) (ELF4, Accession NM\_001421). Accordingly, utilities of VGAM429 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with ELF4. FLJ20716 (Accession NM\_017938) is another VGAM429 host target gene. FLJ20716 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20716, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20716 BINDING SITE, designated SEQ ID:19632, to the nucleotide sequence of VGAM429 RNA, herein designated VGAM RNA, also designated SEQ ID:3140.

[20365] Another function of VGAM429 is therefore inhibition of FLJ20716 (Accession NM\_017938). Accordingly, utilities of VGAM429 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20716. HCC-4 (Accession NM\_138611) is another VGAM429 host target gene. HCC-4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HCC-4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCC-4 BINDING SITE, designated SEQ ID:28898, to the nucleotide sequence of VGAM429

RNA, herein designated VGAM RNA, also designated SEQ ID:3140.

[20366] Another function of VGAM429 is therefore inhibition of HCC-4 (Accession NM\_138611). Accordingly, utilities of VGAM429 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCC-4. IKKE (Accession NM\_014002) is another VGAM429 host target gene. IKKE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IKKE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IKKE BINDING SITE, designated SEQ ID:15205, to the nucleotide sequence of VGAM429 RNA, herein designated VGAM RNA, also designated SEQ ID:3140.

[20367] Another function of VGAM429 is therefore inhibition of IKKE (Accession NM\_014002). Accordingly, utilities of VGAM429 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IKKE. KIAA0794 (Accession XM\_087353) is another VGAM429 host target gene. KIAA0794 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by KIAA0794, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0794 BINDING SITE, designated SEQ ID:39183, to the nucleotide sequence of VGAM429 RNA, herein designated VGAM RNA, also designated SEQ ID:3140.

[20368] Another function of VGAM429 is therefore inhibition of KIAA0794 (Accession XM\_087353). Accordingly, utilities of VGAM429 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0794. KIAA1522 (Accession XM\_036299) is another VGAM429 host target gene. KIAA1522 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1522, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1522 BINDING SITE, designated SEQ ID:32420, to the nucleotide sequence of VGAM429 RNA, herein designated VGAM RNA, also designated SEQ ID:3140.

[20369] Another function of VGAM429 is therefore inhibition of KIAA1522 (Accession XM\_036299). Accordingly, utilities

of VGAM429 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1522. LOC146315 (Accession XM\_027576) is another VGAM429 host target gene. LOC146315 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146315, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146315 BINDING SITE, designated SEQ ID:30534, to the nucleotide sequence of VGAM429 RNA, herein designated VGAM RNA, also designated SEQ ID:3140.

[20370] Another function of VGAM429 is therefore inhibition of LOC146315 (Accession XM\_027576). Accordingly, utilities of VGAM429 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146315. LOC146515 (Accession XM\_085493) is another VGAM429 host target gene. LOC146515 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146515, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC146515 BINDING SITE, designated SEQ ID:38195, to the nucleotide sequence of VGAM429 RNA, herein designated VGAM RNA, also designated SEQ ID:3140.

[20371] Another function of VGAM429 is therefore inhibition of LOC146515 (Accession XM\_085493). Accordingly, utilities of VGAM429 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146515. LOC221025 (Accession XM\_167644) is another VGAM429 host target gene. LOC221025 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221025, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221025 BINDING SITE, designated SEQ ID:44746, to the nucleotide sequence of VGAM429 RNA, herein designated VGAM RNA, also designated SEQ ID:3140.

[20372] Another function of VGAM429 is therefore inhibition of LOC221025 (Accession XM\_167644). Accordingly, utilities of VGAM429 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221025. LOC92661 (Accession XM\_046465) is another VGAM429 host target gene. LOC92661 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92661, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92661 BINDING SITE, designated SEQ ID:34726, to the nucleotide sequence of VGAM429 RNA, herein designated VGAM RNA, also designated SEQ ID:3140.

[20373] Another function of VGAM429 is therefore inhibition of LOC92661 (Accession XM\_046465). Accordingly, utilities of VGAM429 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92661. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 430 (VGAM430) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20374] VGAM430 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM430 was detected is described hereinabove with reference to Figs. 1-8.

[20375] VGAM430 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit Hemorrhagic Disease Virus. VGAM430 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20376] VGAM430 gene encodes a VGAM430 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM430 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM430 precursor RNA is designated SEQ ID:416, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:416 is located at position 6133 relative to the genome of Rabbit Hemorrhagic Disease Virus.

[20377] VGAM430 precursor RNA folds onto itself, forming VGAM430 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[20378] An enzyme complex designated DICER COMPLEX, `dices` the VGAM430 folded precursor RNA into VGAM430 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM430 RNA is designated SEQ ID:3141, and is provided hereinbelow with reference to the sequence listing part.

[20379] VGAM430 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM430 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM430 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[20380] VGAM430 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM430 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM430 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM430 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM430 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[20381] The complementary binding of VGAM430 RNA, herein designated VGAM RNA, to host target binding sites on VGAM430 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM430 host target RNA into VGAM430 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20382] It is appreciated that VGAM430 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM430 host target genes. The mRNA of each one of this plurality of VGAM430 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM430 RNA, herein designated VGAM RNA, and which when bound by VGAM430 RNA causes inhibition of translation of respective one or more VGAM430 host target proteins.

[20383] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM430 gene, herein designated VGAM GENE, on one or more VGAM430 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[20384] It is yet further appreciated that a function of VGAM430 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of viral infection by Rabbit Hemorrhagic Disease Virus. Specific functions, and accordingly utilities, of VGAM430 correlate with, and may be deduced from, the identity of the host target genes which VGAM430 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20385] Nucleotide sequences of the VGAM430 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM430 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM430 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM430 are further described hereinbelow with reference to Table 1.

[20386] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM430 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM430 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20387] As mentioned hereinabove with reference to Fig. 1, a function of VGAM430 gene, herein designated VGAM is inhibition of expression of VGAM430 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM430 correlate with, and may be deduced from, the identity of the target genes which VGAM430 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20388] Adenosine A3 Receptor (ADORA3, Accession NM\_000677) is a VGAM430 host target gene. ADORA3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ADORA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of ADORA3 BINDING SITE, designated SEQ ID:6333, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20389] A function of VGAM430 is therefore inhibition of Adenosine A3 Receptor (ADORA3, Accession NM\_000677), a gene which the activity of this receptor is mediated by G proteins which inhibits adenylyl cyclase. Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADORA3. The function of ADORA3 has been established by previous studies. There are 3 types of adenosine receptors, each of which contains 7 transmembrane domains and interacts with G proteins. The A1 receptors inhibit adenylyl cyclase while the type A2 receptors stimulate activity. Each adenosine receptor has a specific pattern of ligand binding and a unique tissue distribution (Zhao et al., 1995). The A3 adenosine receptor was cloned from rat brain (Zhou et al., 1992) and human heart (Sajjadi and Firestein, 1993). The rat A3 receptor protein is about 50 to 60% identical to the A1 and A2 receptors and has been shown to be an inhibitor of adenylyl cyclase activity. By interspecific backcross analysis, Wilkie et al. (1993)

localized the adenosine A3 receptor to chromosome 3 in the mouse, suggesting a human chromosomal localization of 1p13 from known mouse/human linkage homologies. Zhao et al. (1995) also mapped the A3 receptor by inter-specific backcross analysis to mouse chromosome 3. This prediction was confirmed by Monitto et al. (1995), who mapped the ADORA3 gene to human 1p at a distance between 8 and 17 cM from the centromere. PCR amplification of DNAs from a human/rodent somatic cell hybrid mapping panel was followed by PCR analysis of pooled YAC DNA. From the marker content of the YAC, the gene was thought to map to 1p21-p13.

[20390] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20391] Zhao, Z.; Ravid, S.; Ravid, K. : Chromosomal mapping of the mouse A3 adenosine receptor gene, Adora3. Genomics 30: 118-119, 1995. ; and

[20392] Monitto, C. L.; Levitt, R. C.; DiSilvestre, D.; Holroyd, K. J. : Localization of the A(3) adenosine receptor gene (ADORA3) to human chromosome 1p. Genomics 26: 637-638, 1995.

[20393] Further studies establishing the function and utilities of

ADORA3 are found in John Hopkins OMIM database record ID 600445, and in cited publications numbered 10222–1022 and 11892–10226 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. BCL2–antagonist/killer 1 (BAK1, Accession XM\_166333) is another VGAM430 host target gene. BAK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BAK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAK1 BINDING SITE, designated SEQ ID:44176, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20394] Another function of VGAM430 is therefore inhibition of BCL2–antagonist/killer 1 (BAK1, Accession XM\_166333), a gene which accelerates programmed cell death by binding to, and antagonizing the a repressor bcl–2. Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAK1. The function of BAK1 has been established by previous studies. The BCL2 oncogene (OMIM Ref. No. 151430), which is activated in follicular lymphomas, func–

tions as a potent suppressor of apoptosis under diverse conditions. Chittenden et al. (1995) and Kiefer et al. (1995) described the cDNA cloning and functional analysis of a new BCL2 homolog, BAK, which promotes cell death and counteracts the protection from apoptosis provided by BCL2. Moreover, Chittenden et al. (1995) found that enforced expression of BAK induced rapid and extensive apoptosis of serum-deprived fibroblasts. This suggested that BAK may be directly involved in activating the cell death machinery. Kiefer et al. (1995) pointed out that, like BAX (OMIM Ref. No. 600040), the BAK gene product primarily enhances apoptotic cell death following an appropriate stimulus. Unlike BAX, however, BAK can inhibit cell death in an Epstein-Barr virus-transformed cell line. The caspase-activated form of BID (OMIM Ref. No. 601997), tBID, triggers the homooligomerization of multidomain conserved proapoptotic family members BAK or BAX, resulting in the release of cytochrome c from mitochondria. Wei et al. (2001) found that cells lacking both BAK and BAX, but not cells lacking only one of these components, are completely resistant to tBID-induced cytochrome c release and apoptosis. Moreover, doubly deficient cells are resistant to multiple apoptotic stimuli that act through

disruption of mitochondrial function: staurosporine, ultraviolet radiation, growth factor deprivation, etoposide, and the endoplasmic reticulum stress stimuli thapsigargin and tunicamycin. Thus, Wei et al. (2001) concluded that activation of a 'multidomain' proapoptotic member, BAK or BAX, appears to be an essential gateway to mitochondrial dysfunction required for cell death in response to diverse stimuli. Animal model experiments lend further support to the function of BAK1. Proapoptotic Bcl2 family members have been proposed to play a central role in regulating apoptosis, yet mice lacking Bax display limited phenotypic abnormalities. Lindsten et al. (2000) found that Bak  $-/-$  mice were developmentally normal and reproductively fit and failed to develop any age-related disorders. However, when Bak-deficient mice were mated to Bax-deficient mice to create mice lacking both genes, the majority of Bax  $-/-$  Bak  $-/-$  animals died perinatally, with fewer than 10% surviving into adulthood. Bax  $-/-$  Bak  $-/-$  mice displayed multiple developmental defects, including persistence of interdigital webs, an imperforate vaginal canal, and accumulation of excess cells within both the central nervous and hematopoietic systems. Thus, the authors concluded that Bax and Bak have overlapping roles in the

regulation of apoptosis during mammalian development and tissue homeostasis.

[20395] It is appreciated that the abovementioned animal model for BAK1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[20396] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20397] Chittenden, T.; Harrington, E. A.; O'Connor, R.; Fleming-ton, C.; Lutz, R. J.; Evan, G. I.; Guild, B. C. : Induction of apoptosis by the Bcl-2 homologue Bak. Nature 374: 733-736, 1995. ; and

[20398] Lindsten, T.; Ross, A. J.; King, A.; Zong, W.-X.; Rathmell, J. C.; Shiels, H. A.; Ulrich, E.; Waymire, K. G.; Mahar, P.; Frauwirth, K.; Chen, Y.; Wei, M.; and 9 others : The combined fu.

[20399] Further studies establishing the function and utilities of BAK1 are found in John Hopkins OMIM database record ID 600516, and in cited publications numbered 7163-7165, 7712, 812 and 7714 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Biglycan (BGN, Accession NM\_001711) is another VGAM430 host target gene. BGN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BGN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BGN BINDING SITE, design-

nated SEQ ID:7438, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20400] Another function of VGAM430 is therefore inhibition of Biglycan (BGN, Accession NM\_001711), a gene which is involved in collagen fiber assembly. Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BGN. The function of BGN has been established by previous studies. Biglycan, or proteoglycan-I (PG-I), and decorin, or proteoglycan-II (OMIM Ref. No. 125255) are related but distinct small proteoglycans found in many connective tissues. The sequence of the cDNAs encoding the core proteins indicate that the 2 proteins are composed predominantly of a series of 12 tandem repeats of a nominal 24-residue consensus sequence (Fisher et al., 1989). Biglycan is a single-copy gene about 6 kb in length. By Southern analysis of a panel of human-rodent somatic cell hybrid DNAs with cDNA probes, McBride et al. (1990) demonstrated that BGN is located on the X chromosome. By examining hybrids containing spontaneous breaks or well-characterized translocations, they showed that BGN is in the segment Xq13-qter. Fisher et al. (1991) found

that the BGN gene consists of 8 exons including one that encodes the 5-prime untranslated region of the mRNA. The gene promoter lacked both a CAAT and TATA box that was rich in GC content. By in situ hybridization, they localized the gene to Xq27-qter. Traupe et al. (1992) narrowed the assignment to Xq28 in a region proximal to the red/green cone pigment genes (303800, 303900), G6PD (OMIM Ref. No. 305900), and factor VIII (OMIM Ref. No. 306700), and distal to GABRA3 (OMIM Ref. No. 305660). Since the biglycan gene maps to the region where, by comparative gene mapping, one would expect to find the gene for X-linked dominant chondrodysplasia punctata (CDPX2; 302960), it became a candidate gene for that disorder. To test this possibility, Das et al. (1994) analyzed patient samples for mutations in the biglycan gene by SSCP analysis. The small size of the biglycan gene and the availability of its sequence and intron/exon structure (Fisher et al., 1991) made its analysis as a candidate gene relatively straightforward. No mutations were found in 7 unrelated females with chondrodysplasia punctata, 2 of whom had a positive family history and all of whom were clinically consistent with the X-linked dominant form of the disease. Das et al. (1994) excluded biglycan as the site

of the mutation in 2 other disorders that mapped to the same region of the X chromosome. No mutations were found in 9 unrelated patients with dyskeratosis congenita (DKC; 305000), 3 of whom had a family history indicative of X-linked inheritance. Similarly, no mutations were found in the biglycan gene in 8 unrelated females with incontinentia pigmenti (IP2; 308300); 1 had a positive family history and 7 represented sporadic cases. Animal model experiments lend further support to the function of BGN. In vitro studies indicate that biglycan may function in connective tissue metabolism by binding to collagen fibrils and TGF-beta (OMIM Ref. No. 190180), and may promote neuronal survival. To study the role of biglycan in vivo, Xu et al. (1998) generated Bgn-deficient mice. Although apparently normal at birth, these mice displayed a phenotype characterized by reduced growth rate and decreased bone mass. This may be the first report in which deficiency of a noncollagenous extracellular matrix (ECM) protein leads to a skeletal phenotype that is marked by low bone mass that becomes more obvious with age. These mice may serve as an animal model to study the role of ECM proteins in osteoporosis.

[20401] It is appreciated that the abovementioned animal model

for BGN is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[20402] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20403] Fisher, L. W.; Termine, J. D.; Young, M. F. : Deduced-protein sequence of bone small proteoglycan I (biglycan) shows homology with proteoglycan II (decorin) and several nonconnective tissue proteins in a variety of species. J. Biol. Chem. 264: 4571–4576, 1989. ; and

[20404] Xu, T.; Bianco, P.; Fisher, L. W.; Longenecker, G.; Smith, E.; Goldstein, S.; Bonadio, J.; Boskey, A.; Heegaard, A.-M.; Sommer, B.; Satomura, K.; Dominguez, P.; Zhao, C.; Kulkarni, A. B.

[20405] Further studies establishing the function and utilities of BGN are found in John Hopkins OMIM database record ID 301870, and in cited publications numbered 9168–9176 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Contactin 2 (axonal) (CNTN2, Accession NM\_005076) is another VGAM430 host target gene. CNTN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by CNTN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNTN2 BINDING SITE, designated SEQ ID:11524, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20406] Another function of VGAM430 is therefore inhibition of Contactin 2 (axonal) (CNTN2, Accession NM\_005076), a gene which may play a role in axonal growth and cell adhesion. Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNTN2. The function of CNTN2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM259.E2F Transcription Factor 1 (E2F1, Accession XM\_097772) is another VGAM430 host target gene. E2F1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by E2F1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of E2F1 BINDING

SITE, designated SEQ ID:41120, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20407] Another function of VGAM430 is therefore inhibition of E2F Transcription Factor 1 (E2F1, Accession XM\_097772), a gene which involved in cell cycle regulation, mediates G1 arrest when bound to Rb. Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with E2F1. The function of E2F1 has been established by previous studies. A variety of experimental findings point to the transcription factor E2F as a critical determinant of the G1/S-phase transition during the mammalian cell cycle, serving to activate the transcription of a group of genes that encode proteins necessary for DNA replication. In addition, E2F activity appears to be directly regulated by the action of retinoblastoma protein, and indirectly regulated through the action of G1 cyclins and associated kinases. Ohtani et al. (1995) showed that the accumulation of G1 cyclins is regulated by E2F1. E2F binding sites are found in both the cyclin E (OMIM Ref. No. 123837) and cyclin D1 (OMIM Ref. No. 168461) promoters. Both promoters are activated by E2F gene products, and at least for cyclin E, the E2F sites

contribute to cell cycle-dependent control. They found that the endogenous cyclin E gene is activated following expression of the E2F1 product encoded by a recombinant adenovirus vector. Results were interpreted to suggest the involvement of E2F1 and cyclin E in an autoregulatory loop that governs the accumulation of critical activities affecting the progression of cells through G1. Animal model experiments lend further support to the function of E2F1. The retinoblastoma tumor suppressor protein is a transcriptional repressor that regulates gene expression by physically associating with transcription factors such as members of the E2F family. To address the function of E2F1 and the RB/E2F1 complex in vivo, Yamasaki et al. (1996) and Field et al. (1996) produced mice homozygous for a nonfunctional E2F1 allele. Both groups found that mice lacking E2F1 are viable and fertile. However, Yamasaki et al. (1996) found that they show testicular atrophy and exocrine gland dysplasia, and develop a broad and unusual spectrum of tumors. Although overexpression of E2F1 in tissue culture cells can stimulate cell proliferation and be oncogenic, loss of E2F1 in mice resulted in tumorigenesis, demonstrating that E2F1 also functions as a tumor suppressor. Field et al. (1996) found that E2F1

–/– mice exhibit a defect in T-lymphocyte development, leading to an excess of mature T cells due to a maturation stage-specific defect in thymocyte apoptosis. They also observed aberrant cell proliferation. Weinberg (1996) suggested that the findings of these 2 groups indicate that E2F1 satisfies the definition of a tumor suppressor gene.

[20408] It is appreciated that the abovementioned animal model for E2F1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[20409] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20410] Ohtani, K.; DeGregori, J.; Nevins, J. R. : Regulation of the cyclin E gene by transcription factor E2F1. Proc. Nat. Acad. Sci. 92: 12146–12150, 1995. ; and

[20411] Yamasaki, L.; Jacks, T.; Bronson, R.; Goillot, E.; Harlow, E.; Dyson, N. J. : Tumor induction and tissue atrophy in mice lacking E2F-1. Cell 85: 537–548, 1996.

[20412] Further studies establishing the function and utilities of E2F1 are found in John Hopkins OMIM database record ID 189971, and in cited publications numbered 9706–9716, 758–76 and 765–767 listed in the bibliography section

hereinbelow, which are also hereby incorporated by reference. Fucosyltransferase 6 (alpha (1,3) Fucosyltransferase) (FUT6, Accession NM\_000150) is another VGAM430 host target gene. FUT6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FUT6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FUT6 BINDING SITE, designated SEQ ID:5652, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20413] Another function of VGAM430 is therefore inhibition of Fucosyltransferase 6 (alpha (1,3) Fucosyltransferase) (FUT6, Accession NM\_000150), a gene which is involved in the biosynthesis of the e-selectin ligand, sialyl-lewis x. catalyzes the transfer of fucose from gdp- beta-fucose to alpha-2,3 sialylated substrates. Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUT6. The function of FUT6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to

VGAM194.GRAF (Accession NM\_015071) is another VGAM430 host target gene. GRAF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRAF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRAF BINDING SITE, designated SEQ ID:17447, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20414] Another function of VGAM430 is therefore inhibition of GRAF (Accession NM\_015071), a gene which is a GTPase activating protein for p21-rac. Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRAF. The function of GRAF has been established by previous studies. Borkhardt et al. (2000) stated that mutual translocations involving 11q23 in acute leukemias had been demonstrated to show fusion between the mixed lineage leukemia (MLL; 159555) gene and a variety of different partner genes to a total of 23. The detection of a unique t(5;11)(q31;q23) in an infant with juvenile myelomonocytic leukemia and an MLL gene rearrangement provided an

opportunity to clone another MLL fusion partner gene. By cloning the breakpoints in this translocation, Borkhardt et al. (2000) recovered a member of the GTPase-activating protein (GAP) family, which they identified as the human homolog of the avian GRAF gene (Hildebrand et al., 1996). Ishikawa et al. (1998) cloned a GRAF cDNA, which they designated KIAA0621, from a human brain cDNA library and found that it encodes a deduced 753-amino acid protein with a molecular mass of 87 kD. Hildebrand et al. (1996) determined that the GRAF gene is highly homologous to the BCR gene (OMIM Ref. No. 151410), which is also involved in a leukemia-associated translocation. The avian GRAF protein binds to the C-terminal domain of pp125(FAK), one of the tyrosine kinases predicted to be a critical component of the integrin signaling transduction pathway, in an SH3 domain-dependent manner and stimulates the GTPase activity of the GTP-binding protein RhoA. Thus, GRAF acts as a negative regulator of RhoA.

[20415] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20416] Borkhardt, A.; Bojesen, S.; Haas, O. A.; Fuchs, U.; Bartelheimer, D.; Loncarevic, I. F.; Bohle, R. M.; Harbott, J.;

Repp, R.; Jaeger, U.; Viehmann, S.; Henn, T.; Korth, P.; Scharr, D.; Lampert, F. : The human GRAF gene is fused to MLL in a unique t(5;11)(q31;q23) and both alleles are disrupted in three cases of myelodysplastic syndrome/acute myeloid leukemia with a deletion 5q. Proc. Nat. Acad. Sci. 97: 9168–9173, 2000. ; and

[20417] Hildebrand, J. D.; Taylor, J. M.; Parsons, T. J. : An SH3 domain-containing GTPase-activating protein for Rho and Cdc42 associates with focal adhesion kinase. Molec. Cell. Biol. 16: 31.

[20418] Further studies establishing the function and utilities of GRAF are found in John Hopkins OMIM database record ID 605370, and in cited publications numbered 449 and 9440 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Hyperpolarization Activated Cyclic Nucleotide-gated Potassium Channel 4 (HCN4, Accession NM\_005477) is another VGAM430 host target gene. HCN4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HCN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCN4 BIND-

ING SITE, designated SEQ ID:11980, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20419] Another function of VGAM430 is therefore inhibition of Hyperpolarization Activated Cyclic Nucleotide-gated Potassium Channel 4 (HCN4, Accession NM\_005477), a gene which is hyperpolarization activated cyclic nucleotide-gated cation channel 4 and may act as a pacemaker channel in the heart . Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCN4. The function of HCN4 has been established by previous studies. Seifert et al. (1999) demonstrated that heterologous expression of HCN4 produced channels of unusually slow kinetics of activation and inactivation. The mean potential of half-maximal activation was  $-75.2$  mV. The characteristic expression pattern and the sluggish gating suggested to Seifert et al. (1999) that HCN4 controls the rhythmic activity in both thalamocortical neurons and pacemaker cells of the heart. The strong hybridization with testis mRNA further suggested to Seifert et al. (1999) that HCN4 is also expressed in mature spermatozoa or their precursor cells. In this respect, HCN4 may represent

the mammalian equivalent of the HCN channel in the flagellum of sea urchin spermatozoa (Gauss et al., 1998). Seifert et al. (1999) proposed that both the sea urchin channel and the human HCN4 may be involved in the generation of rhythmic activity that controls the waveform of flagellar beating. Sour taste is initiated by protons acting at receptor proteins or channels. Stevens et al. (2001) examined the effects of sour stimuli on taste cells in slices of vallate papilla from rat. From a subset of cells, Stevens et al. (2001) identified a hyperpolarization-activated current that was enhanced by sour stimulation at the taste pore. This current resembled  $I(h)$  found in neurons and cardiomyocytes, a current carried by members of the family of hyperpolarization-activated and cyclic-nucleotide-gated (HCN) channels. Stevens et al. (2001) showed by in situ hybridization and immunohistochemistry that HCN1 and HCN4 are expressed in a subset of taste cells. By contrast, gustducin (OMIM Ref. No. 139395), the G protein involved in bitter and sweet taste, was not expressed in these cells. Stevens et al. (2001) concluded that HCN channels are gated by extracellular protons and may act as receptors for sour taste.

[20420] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [20421] Seifert, R.; Scholten, A.; Gauss, R.; Mincheva, A.; Lichter, P.; Kaupp, U. B. : Molecular characterization of a slowly gating human hyperpolarization-activated channel predominantly expressed in thalamus, heart, and testis. Proc. Nat. Acad. Sci. 96: 9391-9396, 1999. ; and

- [20423] Further studies establishing the function and utilities of HCN4 are found in John Hopkins OMIM database record ID 605206, and in cited publications numbered 6813, 765 and 7657 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. MAP-kinase Activating Death Domain (MADD, Accession NM\_003682) is another VGAM430 host target gene. MADD BINDING SITE1 through MADD BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MADD, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementar-

ity of the nucleotide sequences of MADD BINDING SITE1 through MADD BINDING SITE6, designated SEQ ID:9787, SEQ ID:28252, SEQ ID:28257, SEQ ID:28236, SEQ ID:28242 and SEQ ID:28247 respectively, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20424] Another function of VGAM430 is therefore inhibition of MAP-kinase Activating Death Domain (MADD, Accession NM\_003682), a gene which may regulate two different pathways for neural activities.interacts with the type-1 tumor necrosis factor receptor (TNFR1); death domain-containing protein. Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MADD. The function of MADD has been established by previous studies. Chow and Lee (1996) reported the cDNA sequence of DENN, a novel human gene that is differentially expressed in normal and neoplastic cells (hence, the symbol DENN). Northern blot analysis revealed differential levels of expression of a 6.5-kb DENN transcript in malignant cell lines compared to normal human tissues, where expression was highest in fetal brain and kidney and in adult testis, ovary, brain, and heart. In fetal liver and in several human cancer

cell lines, the authors identified cDNAs representing alternative transcripts of DENN that harbor a deletion of 129 bp encoding 43 amino acids. Present within the serine- and leucine-rich DENN gene product is an arginyl-glycyl-aspartic acid (RGD) cellular adhesion motif and a leucine zipper-like motif. Using the yeast interaction trap system to identify proteins that interact with the death domain of the type 1 tumor necrosis factor receptor (TNFR1; 191190), Schievella et al. (1997) isolated cDNAs encoding 'MAP kinase-activating death domain' (MADD) protein. Immunoblotting of immunoprecipitated proteins from various human cell lines detected an approximately 200-kD MADD protein. The deduced 1,588-amino acid MADD protein contains a C-terminal death domain. The MADD protein associates with TNFR1 through a death domain-death domain interaction. Overexpression of MADD activated the mitogen-activated protein (MAP) kinase ERK2 (OMIM Ref. No. 176948), and expression of the MADD death domain stimulated both the ERK2 and JNK1 (OMIM Ref. No. 601158) MAP kinases and induced the phosphorylation of cytosolic phospholipase A2 (OMIM Ref. No. 600522). The authors suggested that MADD links TNFR1 with MAP kinase activation and arachidonic acid

release. Chow et al. (1998) stated that the DENN and MADD cDNAs and proteins are virtually identical. They found that the DENN gene spans at least 28 kb and is composed of 15 exons, ranging in size from 73 to 1,230 bp, and 14 introns, varying from about 170 bp to 5.3 kb. From genomic studies, they traced the alternative splicing of a 129-bp fragment to an alternative 5-prime donor site involving exon 7. The deduced longer DENN isoform has 1,587 amino acids. Western blot analysis of human MOLT-4 T-lymphoblastic leukemic cell proteins detected a doublet consisting of 138- and 142-kD polypeptides. The authors found the DENN protein concentrated predominantly in the cytosolic compartment of MOLT-4 cells but was restricted to the nuclear compartment of PLC/PRF/5 hepatoma cells

[20425] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20426] Chow, V. T. K.; Lim, K. M.; Lim, D. : The human DENN gene: genomic organization, alternative splicing, and localization to chromosome 11p11.21-p11.22. *Genome* 41: 543-552, 1998. ; and

[20427] Schievella, A. R.; Chen, J. H.; Graham, J. R.; Lin, L.-L. :

MADD, a novel death domain protein that interacts with the type 1 tumor necrosis factor receptor and activates mitogen-activa.

[20428] Further studies establishing the function and utilities of MADD are found in John Hopkins OMIM database record ID 603584, and in cited publications numbered 5841–584 and 1178 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Arginyl Aminopeptidase (aminopeptidase B)–like 1 (RNPEPL1, Accession NM\_018226) is another VGAM430 host target gene. RNPEPL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNPEPL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNPEPL1 BINDING SITE, designated SEQ ID:20160, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20429] Another function of VGAM430 is therefore inhibition of Arginyl Aminopeptidase (aminopeptidase B)–like 1 (RNPEPL1, Accession NM\_018226). Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with RNPEPL1. SH3-domain Binding Protein 2 (SH3BP2, Accession NM\_003023) is another VGAM430 host target gene. SH3BP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SH3BP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3BP2 BINDING SITE, designated SEQ ID:8954, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20430] Another function of VGAM430 is therefore inhibition of SH3-domain Binding Protein 2 (SH3BP2, Accession NM\_003023). Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BP2. Solute Carrier Family 7 (cationic amino acid transporter,  $\gamma^+$  system), Member 5 (SLC7A5, Accession NM\_003486) is another VGAM430 host target gene. SLC7A5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC7A5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC7A5 BINDING SITE, designated SEQ ID:9579, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20431] Another function of VGAM430 is therefore inhibition of Solute Carrier Family 7 (cationic amino acid transporter,  $\gamma^+$  system), Member 5 (SLC7A5, Accession NM\_003486), a gene which mediates transport of large and small neutral amino acids. Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC7A5. The function of SLC7A5 has been established by previous studies. Gaugitsch et al. (1992) cloned a partial human E16 cDNA sequence that was expressed in activated lymphocytes. It was cloned by virtue of its AUUUA rapid degradation signal. Kanai et al. (1998) used expression cloning to isolate a rat cDNA termed LAT1. They showed that LAT1 encoded a protein necessary for system L amino acid transport, thought to be a major route by which cells import large neutral amino acids with branched or aromatic side chains. Mastroberardino et al. (1998) identified the human E16 protein (AF077866) as the first light chain of 4F2

(OMIM Ref. No. 158070), a cell surface glycoprotein, and showed that the resulting heterodimeric complex mediates L-type amino acid transport. Maglott et al. (1994) mapped a gene fragment, EST00889 (OMIM Ref. No. M78741), to chromosome 16 (D16S469E). The map position was refined to 16q24.3 by use of a panel of mouse/human somatic cell hybrids. Maglott et al. (1994) showed that the gene is expressed abundantly in adult lung and liver, and is also expressed in human brain, thymus, retina, and some other tissues.

[20432] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20433] Mastroberardino, L.; Spindler, B.; Pfeiffer, R.; Skelly, P. J.; Loffing, J.; Shoemaker, C. B.; Verrey, F. : Amino-acid transport by heterodimers of 4F2hc/CD98 and members of a permease family. Nature 395: 288–291, 1998. ; and

[20434] Maglott, D. R.; Durkin, A. S.; Lane, S. A.; Callen, D. F.; Feldblyum, T. V.; Nierman, W. C. : The gene for membrane protein E16 (D16S469E) maps to human chromosome 16q24.3 and is expressed.

[20435] Further studies establishing the function and utilities of SLC7A5 are found in John Hopkins OMIM database record

ID 600182, and in cited publications numbered 7345–734 and 8109 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Transient Receptor Potential Cation Channel, Subfamily M, Member 8 (TRPM8, Accession NM\_024080) is another VGAM430 host target gene. TRPM8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPM8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPM8 BINDING SITE, designated SEQ ID:23516, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20436] Another function of VGAM430 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily M, Member 8 (TRPM8, Accession NM\_024080), a gene which is thought to form a receptor-activated calcium permeant cation channel. Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPM8. The function of TRPM8 and its association with various diseases and clinical conditions, has been established by previous studies,

as described hereinabove with reference to VGAM201. Usher Syndrome 3A (USH3A, Accession NM\_052995) is another VGAM430 host target gene. USH3A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by USH3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USH3A BINDING SITE, designated SEQ ID:27561, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20437] Another function of VGAM430 is therefore inhibition of Usher Syndrome 3A (USH3A, Accession NM\_052995). Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USH3A. Xenotropic and Polytopic Retrovirus Receptor (XPR1, Accession NM\_004736) is another VGAM430 host target gene. XPR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by XPR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of XPR1 BINDING SITE, designated SEQ ID:11124, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20438] Another function of VGAM430 is therefore inhibition of Xenotropic and Polytopic Retrovirus Receptor (XPR1, Accession NM\_004736), a gene which is a putative G protein-coupled receptor and a target for xenotropic and polytropic murine leukemia retroviruses. Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XPR1. The function of XPR1 has been established by previous studies. There are 4 classes of murine leukemia virus (MLV): xenotropic (X), ecotropic (E), amphotropic (A), and polytropic (P). X- and E-MLV cannot exogenously infect mouse cells and are inherited as part of the mouse genome. While X-MLV can infect other mammalian species but not cells from laboratory mice, A- (see OMIM Ref. No. SLC20A2; 158378) and P-MLV can infect mouse and other species. See Levy (1999) for a review of MLVs. By cloning a human T-lymphocyte cDNA library into a retroviral vector, transducing the library into naturally X-MLV-resistant mouse fibroblasts, and PCR amplification, Tailor et al.

(1999) isolated a cDNA encoding XPR1. Expression of XPR1 in mouse and hamster MLV-resistant fibroblasts rendered the cells susceptible to both X- and P-MLV. The deduced 696-amino acid XPR1 protein contains 8 or 9 potential membrane-spanning regions, 7 potential N-glycosylation sites, and 7 dileucines that may stimulate endocytosis via clathrin-coated pits. Northern blot analysis detected a 4.5-kb XPR1 transcript in all tissues tested, with highest expression in pancreas, kidney, placenta, hematopoietic tissues, and heart, and lowest expression in skeletal muscle. Expression of XPR1 was greater in fetal liver than adult liver. A 9.5-kb XPR1 transcript was also detected in all tissues tested except liver and bone marrow.

[20439] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20440] Levy, J. A. : Xenotropism: the elusive viral receptor finally uncovered. Proc. Nat. Acad. Sci. 96: 802-804, 1999. ; and

[20441] Taylor, C. S.; Nouri, A.; Lee, C. G.; Kozak, C.; Kabat, D. : Cloning and characterization of a cell surface receptor for xenotropic and polytropic murine leukemia viruses. Proc. Nat. Aca.

[20442] Further studies establishing the function and utilities of XPR1 are found in John Hopkins OMIM database record ID 605237, and in cited publications numbered 7484–7487 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. AF311304 (Accession NM\_031214) is another VGAM430 host target gene. AF311304 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AF311304, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AF311304 BINDING SITE, designated SEQ ID:25262, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20443] Another function of VGAM430 is therefore inhibition of AF311304 (Accession NM\_031214). Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AF311304. DKFZP566G1424 (Accession XM\_097771) is another VGAM430 host target gene. DKFZP566G1424 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DK–

FZP566G1424, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566G1424 BINDING SITE, designated SEQ ID:41115, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20444] Another function of VGAM430 is therefore inhibition of DKFZP566G1424 (Accession XM\_097771). Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566G1424. FBX30 (Accession NM\_033182) is another VGAM430 host target gene. FBX30 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FBX30, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBX30 BINDING SITE, designated SEQ ID:27044, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20445] Another function of VGAM430 is therefore inhibition of FBX30 (Accession NM\_033182). Accordingly, utilities of

VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBX30. FLJ12242 (Accession NM\_024681) is another VGAM430 host target gene. FLJ12242 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12242, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12242 BINDING SITE, designated SEQ ID:23995, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20446] Another function of VGAM430 is therefore inhibition of FLJ12242 (Accession NM\_024681). Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12242. FLJ20294 (Accession NM\_017749) is another VGAM430 host target gene. FLJ20294 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20294 BINDING SITE,

designated SEQ ID:19354, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20447] Another function of VGAM430 is therefore inhibition of FLJ20294 (Accession NM\_017749). Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20294. FLJ21742 (Accession NM\_032207) is another VGAM430 host target gene. FLJ21742 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21742, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21742 BINDING SITE, designated SEQ ID:25914, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20448] Another function of VGAM430 is therefore inhibition of FLJ21742 (Accession NM\_032207). Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21742. FLJ22215 (Accession XM\_173021) is another VGAM430 host target gene. FLJ22215 BINDING SITE is HOST TARGET

binding site found in the 3` untranslated region of mRNA encoded by FLJ22215, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22215 BINDING SITE, designated SEQ ID:46284, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20449] Another function of VGAM430 is therefore inhibition of FLJ22215 (Accession XM\_173021). Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22215. HEMK (Accession NM\_016173) is another VGAM430 host target gene. HEMK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HEMK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HEMK BINDING SITE, designated SEQ ID:18269, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20450] Another function of VGAM430 is therefore inhibition of

HEMK (Accession NM\_016173). Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEMK. KIAA0182 (Accession XM\_050495) is another VGAM430 host target gene. KIAA0182 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0182, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0182 BINDING SITE, designated SEQ ID:35648, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20451] Another function of VGAM430 is therefore inhibition of KIAA0182 (Accession XM\_050495). Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0182. KIAA0323 (Accession XM\_032634) is another VGAM430 host target gene. KIAA0323 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0323, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0323 BINDING SITE, designated SEQ ID:31690, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20452] Another function of VGAM430 is therefore inhibition of KIAA0323 (Accession XM\_032634). Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0323. KIAA0415 (Accession XM\_166527) is another VGAM430 host target gene. KIAA0415 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0415, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0415 BINDING SITE, designated SEQ ID:44479, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20453] Another function of VGAM430 is therefore inhibition of KIAA0415 (Accession XM\_166527). Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0415. KIAA0420 (Accession XM\_032693) is another

VGAM430 host target gene. KIAA0420 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0420, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0420 BINDING SITE, designated SEQ ID:31732, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20454] Another function of VGAM430 is therefore inhibition of KIAA0420 (Accession XM\_032693). Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0420. KIAA0556 (Accession XM\_044632) is another VGAM430 host target gene. KIAA0556 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0556, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0556 BINDING SITE, designated SEQ ID:34250, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20455] Another function of VGAM430 is therefore inhibition of KIAA0556 (Accession XM\_044632). Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0556. KIAA1950 (Accession XM\_166532) is another VGAM430 host target gene. KIAA1950 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1950, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1950 BINDING SITE, designated SEQ ID:44490, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20456] Another function of VGAM430 is therefore inhibition of KIAA1950 (Accession XM\_166532). Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1950. KRT6IRS (Accession NM\_033448) is another VGAM430 host target gene. KRT6IRS BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KRT6IRS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KRT6IRS BINDING SITE, designated SEQ ID:27253, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20457] Another function of VGAM430 is therefore inhibition of KRT6IRS (Accession NM\_033448). Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KRT6IRS. Matrin 3 (MATR3, Accession NM\_018834) is another VGAM430 host target gene. MATR3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MATR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MATR3 BINDING SITE, designated SEQ ID:20820, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20458] Another function of VGAM430 is therefore inhibition of Matrin 3 (MATR3, Accession NM\_018834). Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with MATR3. MGC35558 (Accession NM\_145013) is another VGAM430 host target gene. MGC35558 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC35558, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC35558 BINDING SITE, designated SEQ ID:29620, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20459] Another function of VGAM430 is therefore inhibition of MGC35558 (Accession NM\_145013). Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC35558. MGC4415 (Accession NM\_031484) is another VGAM430 host target gene. MGC4415 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4415, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4415 BINDING SITE, designated SEQ ID:25572, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM

RNA, also designated SEQ ID:3141.

[20460] Another function of VGAM430 is therefore inhibition of MGC4415 (Accession NM\_031484). Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4415. RAB3A Interacting Protein (rabin3)-like 1 (RAB3IL1, Accession NM\_013401) is another VGAM430 host target gene. RAB3IL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB3IL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB3IL1 BINDING SITE, designated SEQ ID:15064, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20461] Another function of VGAM430 is therefore inhibition of RAB3A Interacting Protein (rabin3)-like 1 (RAB3IL1, Accession NM\_013401). Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB3IL1. Splicing Factor, Arginine/serine-rich 5 (SFRS5, Accession NM\_006925) is another VGAM430 host target gene. SFRS5 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SFRS5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRS5 BINDING SITE, designated SEQ ID:13806, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20462] Another function of VGAM430 is therefore inhibition of Splicing Factor, Arginine/serine-rich 5 (SFRS5, Accession NM\_006925). Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRS5. TAF5-like RNA Polymerase II, P300/CBP-associated Factor (PCAF)-associated Factor, 65kDa (TAF5L, Accession NM\_014409) is another VGAM430 host target gene. TAF5L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TAF5L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAF5L BINDING SITE, designated SEQ ID:15752, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also design-

nated SEQ ID:3141.

[20463] Another function of VGAM430 is therefore inhibition of TAF5-like RNA Polymerase II, P300/CBP-associated Factor (PCAF)-associated Factor, 65kDa (TAF5L, Accession NM\_014409). Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAF5L. LOC150157 (Accession XM\_097823) is another VGAM430 host target gene. LOC150157 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150157, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150157 BINDING SITE, designated SEQ ID:41146, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20464] Another function of VGAM430 is therefore inhibition of LOC150157 (Accession XM\_097823). Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150157. LOC152756 (Accession XM\_098262) is another VGAM430 host target gene. LOC152756 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152756, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152756 BINDING SITE, designated SEQ ID:41552, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20465] Another function of VGAM430 is therefore inhibition of LOC152756 (Accession XM\_098262). Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152756. LOC196890 (Accession XM\_116951) is another VGAM430 host target gene. LOC196890 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196890, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196890 BINDING SITE, designated SEQ ID:43157, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20466] Another function of VGAM430 is therefore inhibition of

LOC196890 (Accession XM\_116951). Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196890. LOC202934 (Accession XM\_117486) is another VGAM430 host target gene. LOC202934 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202934, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202934 BINDING SITE, designated SEQ ID:43466, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20467] Another function of VGAM430 is therefore inhibition of LOC202934 (Accession XM\_117486). Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202934. LOC253675 (Accession XM\_172990) is another VGAM430 host target gene. LOC253675 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253675, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC253675 BINDING SITE, designated SEQ ID:46268, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20468] Another function of VGAM430 is therefore inhibition of LOC253675 (Accession XM\_172990). Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253675. LOC255465 (Accession XM\_173206) is another VGAM430 host target gene. LOC255465 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255465 BINDING SITE, designated SEQ ID:46458, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20469] Another function of VGAM430 is therefore inhibition of LOC255465 (Accession XM\_173206). Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255465. LOC257354 (Accession XM\_170810) is an-

other VGAM430 host target gene. LOC257354 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257354, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257354 BINDING SITE, designated SEQ ID:45585, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20470] Another function of VGAM430 is therefore inhibition of LOC257354 (Accession XM\_170810). Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257354. LOC90075 (Accession XM\_028742) is another VGAM430 host target gene. LOC90075 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90075, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90075 BINDING SITE, designated SEQ ID:30741, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20471] Another function of VGAM430 is therefore inhibition of LOC90075 (Accession XM\_028742). Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90075. LOC90362 (Accession XM\_031163) is another VGAM430 host target gene. LOC90362 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC90362, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90362 BINDING SITE, designated SEQ ID:31297, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20472] Another function of VGAM430 is therefore inhibition of LOC90362 (Accession XM\_031163). Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90362. LOC91461 (Accession XM\_038576) is another VGAM430 host target gene. LOC91461 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC91461, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91461 BINDING SITE, designated SEQ ID:32870, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20473] Another function of VGAM430 is therefore inhibition of LOC91461 (Accession XM\_038576). Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91461. LOC93259 (Accession XM\_050105) is another VGAM430 host target gene. LOC93259 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC93259, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93259 BINDING SITE, designated SEQ ID:35557, to the nucleotide sequence of VGAM430 RNA, herein designated VGAM RNA, also designated SEQ ID:3141.

[20474] Another function of VGAM430 is therefore inhibition of LOC93259 (Accession XM\_050105). Accordingly, utilities of VGAM430 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC93259. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 431 (VGAM431) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20475] VGAM431 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM431 was detected is described hereinabove with reference to Figs. 1–8.

[20476] VGAM431 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit Hemorrhagic Disease Virus. VGAM431 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20477] VGAM431 gene encodes a VGAM431 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM431 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM431 precursor RNA is designated SEQ ID:417, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:417 is located at position 3819 relative to the genome of Rabbit Hemorrhagic Disease Virus.

[20478] VGAM431 precursor RNA folds onto itself, forming VGAM431 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20479] An enzyme complex designated DICER COMPLEX, `dices` the VGAM431 folded precursor RNA into VGAM431 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM431 RNA is designated SEQ ID:3142, and is provided hereinbelow with reference to the sequence listing part.

[20480] VGAM431 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM431 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM431 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[20481] VGAM431 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM431 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM431 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM431 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM431 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[20482] The complementary binding of VGAM431 RNA, herein designated VGAM RNA, to host target binding sites on VGAM431 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM431 host target RNA into VGAM431 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20483] It is appreciated that VGAM431 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM431 host target genes. The mRNA of each one of this plurality of VGAM431 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM431 RNA, herein designated VGAM RNA, and which when bound by VGAM431 RNA causes in-

hibition of translation of respective one or more VGAM431 host target proteins.

[20484] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM431 gene, herein designated VGAM GENE, on one or more VGAM431 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[20485] It is yet further appreciated that a function of VGAM431 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM431 include diagnosis, prevention and

treatment of viral infection by Rabbit Hemorrhagic Disease Virus. Specific functions, and accordingly utilities, of VGAM431 correlate with, and may be deduced from, the identity of the host target genes which VGAM431 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20486] Nucleotide sequences of the VGAM431 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM431 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM431 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM431 are further described hereinbelow with reference to Table 1.

[20487] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM431 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM431 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20488] As mentioned hereinabove with reference to Fig. 1, a function of VGAM431 gene, herein designated VGAM is inhibition of expression of VGAM431 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM431 correlate with, and may be deduced from, the identity of the target genes which VGAM431 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20489] BCL2-like 2 (BCL2L2, Accession NM\_004050) is a VGAM431 host target gene. BCL2L2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL2L2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL2L2 BINDING SITE, designated SEQ ID:10261, to the nucleotide sequence of VGAM431 RNA, herein designated VGAM RNA, also designated SEQ ID:3142.

[20490] A function of VGAM431 is therefore inhibition of BCL2-like 2 (BCL2L2, Accession NM\_004050), a gene which promotes cell survival. Accordingly, utilities of VGAM431 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL2L2. The function of BCL2L2 has been established by previous studies. Gibson et al. (1996) used degenerate PCR to clone a novel BCL2 homolog which they denoted BCLW. The

gene encodes a 193–amino acid polypeptide. Gibson et al. (1996) also isolated the mouse BCLW gene; its amino acid sequence is 99% identical to that of the human gene.

Mouse BCLW is expressed as a 3.7–kb mRNA in a variety of tissues, with highest expression in brain, colon, and salivary gland. In mouse hematopoietic cell lines, BCLW is expressed in myeloid cells and to a lesser extent in lymphoid cells. Like BCL2, expressed BCLW promotes cell survival under a variety of cytotoxic conditions. Gibson et al. (1996) used fluorescence in situ hybridization to map the BCLW gene to human chromosome 14q11.2–q12. Animal model experiments lend further support to the function of BCL2L2. To identify genes required for mammalian spermatogenesis, Ross et al. (1998) screened lines of mutant mice created using a retroviral gene–trap system for male infertility. Homozygous ROSA41 male mice exhibited sterility associated with progressive testicular degeneration. Germ cell defects were first observed at 19 days postnatal. Spermatogenesis was blocked during late spermiogenesis in young adults. Gradual depletion of all stages of germ cells resulted in a Sertoli–cell–only phenotype by approximately 6 months of age. Subsequently, almost all Sertoli cells were lost from the seminiferous

tubules, and the Leydig cell population was reduced. Molecular analysis indicated that the gene mutated in these mice is BCLW, a death-protecting member of the Bcl2 family. The mutant allele of Bclw in ROSA41 did not produce a Bclw polypeptide. Expression of Bclw in the testis appeared to be restricted to elongating spermatids and Sertoli cells.

[20491] It is appreciated that the abovementioned animal model for BCL2L2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[20492] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20493] Gibson, L.; Holmgreen, S. P.; Huang, D. C. S.; Bernard, O.; Copeland, N. G.; Jenkins, N. A.; Sutherland, G. R.; Baker, E.; Adams, J. M.; Cory, S. : bcl-w, a novel member of the bcl-2 family, promotes cell survival. *Oncogene* 13: 665-675, 1996. ; and

[20494] Ross, A. J.; Waymire, K. G.; Moss, J. E.; Parlow, A. F.; Skinner, M. K.; Russell, L. D.; MacGregor, G. R. : Testicular degeneration in Bclw-deficient mice. *Nature Genet.* 18: 251-256, 1999.

[20495] Further studies establishing the function and utilities of BCL2L2 are found in John Hopkins OMIM database record ID 601931, and in cited publications numbered 6256–6257 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Reserved (C8orf13, Accession XM\_088377) is another VGAM431 host target gene. C8orf13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C8orf13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C8orf13 BINDING SITE, designated SEQ ID:39655, to the nucleotide sequence of VGAM431 RNA, herein designated VGAM RNA, also designated SEQ ID:3142.

[20496] Another function of VGAM431 is therefore inhibition of Reserved (C8orf13, Accession XM\_088377). Accordingly, utilities of VGAM431 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C8orf13. Opiate Receptor-like 1 (OPRL1, Accession NM\_000913) is another VGAM431 host target gene. OPRL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OPRL1,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OPRL1 BINDING SITE, designated SEQ ID:6613, to the nucleotide sequence of VGAM431 RNA, herein designated VGAM RNA, also designated SEQ ID:3142.

[20497] Another function of VGAM431 is therefore inhibition of Opiate Receptor-like 1 (OPRL1, Accession NM\_000913). Accordingly, utilities of VGAM431 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OPRL1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 432 (VGAM432) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20498] VGAM432 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM432 was detected is described hereinabove with reference to Figs. 1–8.

[20499] VGAM432 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Rabbit Hemorrhagic Dis–

ease Virus. VGAM432 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20500] VGAM432 gene encodes a VGAM432 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM432 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM432 precursor RNA is designated SEQ ID:418, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:418 is located at position 3603 relative to the genome of Rabbit Hemorrhagic Disease Virus.

[20501] VGAM432 precursor RNA folds onto itself, forming VGAM432 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20502] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM432 folded precursor RNA into VGAM432 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM432 RNA is designated SEQ ID:3143, and is provided hereinbelow with reference to the sequence listing part.

[20503] VGAM432 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM432 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM432 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[20504] VGAM432 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM432 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM432 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM432 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM432 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[20505] The complementary binding of VGAM432 RNA, herein designated VGAM RNA, to host target binding sites on VGAM432 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM432 host target RNA into VGAM432 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20506] It is appreciated that VGAM432 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM432 host target genes. The mRNA of each one of this plurality of VGAM432 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM432 RNA, herein designated VGAM RNA, and which when bound by VGAM432 RNA causes inhibition of translation of respective one or more VGAM432 host target proteins.

[20507] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM432 gene, herein designated VGAM GENE, on one or more VGAM432 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[20508] It is yet further appreciated that a function of VGAM432 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM432 include diagnosis, prevention and treatment of viral infection by Rabbit Hemorrhagic Disease Virus. Specific functions, and accordingly utilities, of VGAM432 correlate with, and may be deduced from, the identity of the host target genes which VGAM432 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20509] Nucleotide sequences of the VGAM432 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM432 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM432 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM432 are further described hereinbelow with reference to Table 1.

[20510] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM432 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM432 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20511] As mentioned hereinabove with reference to Fig. 1, a function of VGAM432 gene, herein designated VGAM is inhibition of expression of VGAM432 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM432 correlate with, and may be deduced from, the identity of the target genes which VGAM432 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20512] Cadherin, EGF LAG Seven-pass G-type Receptor 2 (flamingo homolog, Drosophila) (CELSR2, Accession NM\_001408) is a VGAM432 host target gene. CELSR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CELSR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of CELSR2 BINDING SITE, designated SEQ ID:7109, to the nucleotide sequence of VGAM432 RNA, herein designated VGAM RNA, also designated SEQ ID:3143.

[20513] A function of VGAM432 is therefore inhibition of Cadherin, EGF LAG Seven-pass G-type Receptor 2 (flamingo homolog, Drosophila) (CELSR2, Accession NM\_001408), a gene which is a calcium dependent cell adhesion protein. Accordingly, utilities of VGAM432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CELSR2. The function of CELSR2 has been established by previous studies. The domain that characterizes epidermal growth factor (EGF; 131530) consists of approximately 50 amino acids with 3 disulfide bonds. EGF-like domains are believed to play a critical role in a number of extracellular events, including cell adhesion and receptor-ligand interactions. Proteins with EGF-like domains often consist of more than 1,000 amino acids, have multiple copies of the EGF-like domain, and contain additional domains known to be involved in specific protein-protein interactions. To identify proteins containing EGF-like domains, Nakayama et al. (1998) searched a database of long cDNA sequences randomly selected from a human brain cDNA library for those that encode an EGF-

like motif. They identified several partial cDNAs encoding novel proteins with EGF-like domains, such as EGFL2, which they named MEGF3. The predicted partial EGFL2 protein has at least 5 cadherin motifs, 6 EGF-like domains, 2 laminin G domains (see OMIM Ref. No. 601033), 7 transmembrane domains, and a cytoplasmic proline-rich sequence. Human EGFL2 appears to have a domain structure identical to that of rat Megf2 (OMIM Ref. No. 604264), whose complete coding sequence was also isolated by the authors. Northern blot analysis detected rat Megf3 expression in several regions of the brain.

[20514] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20515] Nagase, T.; Seki, N.; Ishikawa, K.; Ohira, M.; Kwarabayasi, Y.; Ohara, O.; Tanaka, A.; Kotani, H.; Miyajima, N.; Nomura, N. : Prediction of the coding sequences of unidentified human genes. VI. The coding sequences of 80 new genes (KIAA0201-KIAA0280) deduced by analysis of cDNA clones from cell line KG-1 and brain. DNA Res. 3: 321-329, 1996. ; and

[20516] Nakayama, M.; Nakajima, D.; Nagase, T.; Nomura, N.; Seki, N.; Ohara, O. : Identification of high-molecular-weight

proteins with multiple EGF-like motifs by motif-trap screening. Genomic.

[20517] Further studies establishing the function and utilities of CELSR2 are found in John Hopkins OMIM database record ID 604265, and in cited publications numbered 9379 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Egl Nine Homolog 2 (C. elegans) (EGLN2, Accession NM\_080732) is another VGAM432 host target gene. EGLN2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EGLN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGLN2 BINDING SITE, designated SEQ ID:28022, to the nucleotide sequence of VGAM432 RNA, herein designated VGAM RNA, also designated SEQ ID:3143.

[20518] Another function of VGAM432 is therefore inhibition of Egl Nine Homolog 2 (C. elegans) (EGLN2, Accession NM\_080732), a gene which is an essential component of the pathway. Accordingly, utilities of VGAM432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGLN2. The function of

EGLN2 has been established by previous studies. In cultured mammalian cells, Bruick and McKnight (2001) found that the inappropriate accumulation of HIF caused by forced expression of the HIF1- $\alpha$  subunit under normoxic conditions was attenuated by coexpression of HPH. Suppression of HPH in cultured *Drosophila melanogaster* cells by RNA interference resulted in elevated expression of the hypoxia-inducible gene LDH (see OMIM Ref. No. 150000) under normoxic conditions. Bruick and McKnight (2001) concluded that HPH is an essential component of the pathway through which cells sense oxygen. HIF is a transcriptional complex that plays a central role in mammalian oxygen homeostasis. Posttranslational modification by prolyl hydroxylation is a key regulatory event that targets HIF- $\alpha$  (HIF1; 603348) subunits for proteasomal destruction via the von Hippel-Lindau (VHL; 193300) ubiquitylation complex. Epstein et al. (2001) defined a conserved HIF-VHL-prolyl hydroxylase pathway in *C. elegans* and identified Egl9 as a dioxygenase that regulates HIF by prolyl hydroxylation. In mammalian cells, they showed that the HIF-prolyl hydroxylases are represented by 3 proteins with a conserved 2-histidine-1-carboxylate iron coordination motif at the catalytic site. The genes en-

coding these proteins were cloned and termed PHD1, PHD2 (OMIM Ref. No. 606425), and PHD3 (OMIM Ref. No. 606426) by the authors. Direct modulation of recombinant enzyme activity by graded hypoxia, iron chelation, and cobaltous ions mirrored the characteristics of HIF induction in vivo, fulfilling requirements for these enzymes being oxygen sensors that regulate HIF.

[20519] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20520] Bruick, R. K.; McKnight, S. L. : A conserved family of prolyl-4-hydroxylases that modify HIF. Science 294: 1337-1340, 2001. ; and

[20521] Epstein, A. C. R.; Gleadle, J. M.; McNeill, L. A.; Hewitson, K. S.; O'Rourke, J.; Mole, D. R.; Mukherji, M.; Metzen, E.; Wilson, M. I.; Dhanda, A.; Tian, Y.-M.; Masson, N.; Hamilton, D.

[20522] Further studies establishing the function and utilities of EGLN2 are found in John Hopkins OMIM database record ID 606424, and in cited publications numbered 4543-4544 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Frizzled Homolog 1 (Drosophila) (FZD1, Accession NM\_003505) is

another VGAM432 host target gene. FZD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FZD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FZD1 BINDING SITE, designated SEQ ID:9594, to the nucleotide sequence of VGAM432 RNA, herein designated VGAM RNA, also designated SEQ ID:3143.

[20523] Another function of VGAM432 is therefore inhibition of Frizzled Homolog 1 (Drosophila) (FZD1, Accession NM\_003505), a gene which may be involved in bone resorption; strongly similar to rat Fzd. Accordingly, utilities of VGAM432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FZD1. The function of FZD1 has been established by previous studies. Members of the 'frizzled' (Fz) gene family encode 7-transmembrane domain proteins that are receptors for Wnt (see OMIM Ref. No. 164975) signaling proteins. See 601766. Liu et al. (2001) constructed a chimeric receptor with the ligand-binding and transmembrane segments from the beta-2-adrenergic receptor (OMIM Ref. No. 109690) and the cytoplasmic domains from rat frizzled-1.

Stimulation of mouse F9 clones expressing the chimera with the beta-adrenergic agonist isoproterenol stimulated stabilization of beta-catenin (OMIM Ref. No. 116806), activation of a beta-catenin-sensitive promoter, and formation of primitive endoderm. The response was blocked by inactivation of pertussis toxin-sensitive, heterotrimeric G proteins, and by depletion of G-alpha-q (OMIM Ref. No. 600998) and G-alpha-o (OMIM Ref. No. 139311). Thus, Liu et al. (2001) concluded that G proteins are elements of Wnt/frizzled-1 signaling to the beta-catenin-lymphoid-enhancer factor (LEF)-T-cell factor (Tcf) pathway.

[20524] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20525] Liu, T.; DeCostanzo, A. J.; Liu, X.; Wang, H.; Hallagan, S.; Moon, R. T.; Malbon, C. C. : G protein signaling from activated rat frizzled-1 to the beta-catenin-Lef-Tcf pathway. Science 292: 1718-1722, 2001. ; and

[20526] Sagara, N.; Toda, G.; Hirai, M.; Terada, M.; Katoh, M. : Molecular cloning, differential expression, and chromosomal localization of human frizzled-1, frizzled-2, and frizzled-7. Bioch.

[20527] Further studies establishing the function and utilities of FZD1 are found in John Hopkins OMIM database record ID 603408, and in cited publications numbered 5301–5302 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ATP6V1EL2 (Accession NM\_080653) is another VGAM432 host target gene. ATP6V1EL2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ATP6V1EL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP6V1EL2 BINDING SITE, designated SEQ ID:27941, to the nucleotide sequence of VGAM432 RNA, herein designated VGAM RNA, also designated SEQ ID:3143.

[20528] Another function of VGAM432 is therefore inhibition of ATP6V1EL2 (Accession NM\_080653). Accordingly, utilities of VGAM432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP6V1EL2. FLJ00001 (Accession XM\_088525) is another VGAM432 host target gene. FLJ00001 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ00001, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00001 BINDING SITE, designated SEQ ID:39789, to the nucleotide sequence of VGAM432 RNA, herein designated VGAM RNA, also designated SEQ ID:3143.

[20529] Another function of VGAM432 is therefore inhibition of FLJ00001 (Accession XM\_088525). Accordingly, utilities of VGAM432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00001. KIAA0628 (Accession NM\_014789) is another VGAM432 host target gene. KIAA0628 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0628, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0628 BINDING SITE, designated SEQ ID:16676, to the nucleotide sequence of VGAM432 RNA, herein designated VGAM RNA, also designated SEQ ID:3143.

[20530] Another function of VGAM432 is therefore inhibition of KIAA0628 (Accession NM\_014789). Accordingly, utilities of VGAM432 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0628. KIAA0652 (Accession NM\_014741) is another VGAM432 host target gene. KIAA0652 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0652, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0652 BINDING SITE, designated SEQ ID:16411, to the nucleotide sequence of VGAM432 RNA, herein designated VGAM RNA, also designated SEQ ID:3143.

[20531] Another function of VGAM432 is therefore inhibition of KIAA0652 (Accession NM\_014741). Accordingly, utilities of VGAM432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0652. KIAA1389 (Accession XM\_045839) is another VGAM432 host target gene. KIAA1389 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1389, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1389 BINDING SITE, designated SEQ ID:34570, to the

nucleotide sequence of VGAM432 RNA, herein designated VGAM RNA, also designated SEQ ID:3143.

[20532] Another function of VGAM432 is therefore inhibition of KIAA1389 (Accession XM\_045839). Accordingly, utilities of VGAM432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1389. KIAA1889 (Accession XM\_056298) is another VGAM432 host target gene. KIAA1889 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1889, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1889 BINDING SITE, designated SEQ ID:36390, to the nucleotide sequence of VGAM432 RNA, herein designated VGAM RNA, also designated SEQ ID:3143.

[20533] Another function of VGAM432 is therefore inhibition of KIAA1889 (Accession XM\_056298). Accordingly, utilities of VGAM432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1889. MGC29654 (Accession XM\_039448) is another VGAM432 host target gene. MGC29654 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by MGC29654, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC29654 BINDING SITE, designated SEQ ID:33094, to the nucleotide sequence of VGAM432 RNA, herein designated VGAM RNA, also designated SEQ ID:3143.

[20534] Another function of VGAM432 is therefore inhibition of MGC29654 (Accession XM\_039448). Accordingly, utilities of VGAM432 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC29654. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 433 (VGAM433) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20535] VGAM433 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM433 was detected is described hereinabove with reference to Figs. 1–8.

[20536] VGAM433 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Rabbit Hemorrhagic Disease Virus. VGAM433 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20537] VGAM433 gene encodes a VGAM433 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM433 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM433 precursor RNA is designated SEQ ID:419, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:419 is located at position 1022 relative to the genome of Rabbit Hemorrhagic Disease Virus.

[20538] VGAM433 precursor RNA folds onto itself, forming VGAM433 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20539] An enzyme complex designated DICER COMPLEX, `dices` the VGAM433 folded precursor RNA into VGAM433 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM433 RNA is designated SEQ ID:3144, and is provided hereinbelow with reference to the sequence listing part.

[20540] VGAM433 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM433 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM433 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[20541] VGAM433 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM433 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM433 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM433 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM433 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[20542] The complementary binding of VGAM433 RNA, herein designated VGAM RNA, to host target binding sites on VGAM433 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM433 host tar-

get RNA into VGAM433 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20543] It is appreciated that VGAM433 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM433 host target genes. The mRNA of each one of this plurality of VGAM433 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM433 RNA, herein designated VGAM RNA, and which when bound by VGAM433 RNA causes inhibition of translation of respective one or more VGAM433 host target proteins.

[20544] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM433 gene, herein designated VGAM GENE, on one or more VGAM433 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[20545] It is yet further appreciated that a function of VGAM433 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM433 include diagnosis, prevention and treatment of viral infection by Rabbit Hemorrhagic Disease Virus. Specific functions, and accordingly utilities, of VGAM433 correlate with, and may be deduced from, the identity of the host target genes which VGAM433 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20546] Nucleotide sequences of the VGAM433 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM433 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM433 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM433 are further

described hereinbelow with reference to Table 1.

[20547] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM433 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM433 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20548] As mentioned hereinabove with reference to Fig. 1, a function of VGAM433 gene, herein designated VGAM is inhibition of expression of VGAM433 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM433 correlate with, and may be deduced from, the identity of the target genes which VGAM433 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20549] B-cell CLL/lymphoma 10 (BCL10, Accession NM\_003921) is a VGAM433 host target gene. BCL10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL10 BIND-

ING SITE, designated SEQ ID:10007, to the nucleotide sequence of VGAM433 RNA, herein designated VGAM RNA, also designated SEQ ID:3144.

[20550] A function of VGAM433 is therefore inhibition of B-cell CLL/lymphoma 10 (BCL10, Accession NM\_003921), a gene which is a positive regulator of lymphocyte proliferation, NF-kappaB activator. Accordingly, utilities of VGAM433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL10. The function of BCL10 has been established by previous studies. B-cell lymphomas of mucosa-associated lymphoid tissue (MALT lymphomas) are the most common form of lymphoma arising in extranodal sites, in most cases arising in the gastric mucosa (Isaacson and Spencer, 1995). Cytogenetic studies of low-grade malignant MALT lymphoma identified abnormalities of chromosome 1p22, in particular translocation t(1;14)(p22;q32), as uncommon but recurrent events (Wotherspoon et al., 1992). Willis et al. (1999) cloned a t(1;14)(p22;q32) translocation breakpoint from a case of low-grade MALT lymphoma and identified a recurrent breakpoint upstream of the promoter of a novel gene, BCL10. The BCL10 gene encodes a predicted protein of 233 amino acids and is a cellular homolog of

the equine herpesvirus-2 gene (E10); both contain an amino-terminal caspase recruitment domain (CARD) homologous to that found in several apoptotic molecules. BCL10 was found to be expressed as a transcript of 4.2 kb in all normal and malignant tissues examined. BCL10 and E10 activated nuclear factor kappa-B (NFkB; 164011) but caused apoptosis of 293 cells. BCL10 expressed in a MALT lymphoma exhibited a frameshift mutation resulting in truncation distal to the CARD. Truncated BCL10 activated NFkB but did not induce apoptosis. Wildtype BCL10 suppressed transformation, whereas mutant forms had lost this activity and displayed gain-of-function transforming activity. Animal model experiments lend further support to the function of BCL10. Ruland et al. (2001) showed that one-third of Bcl10  $-/-$  mouse embryos developed exencephaly, leading to embryonic lethality. Surprisingly, Bcl10  $-/-$  cells retained susceptibility to various apoptotic stimuli in vivo and in vitro. However, surviving Bcl10  $-/-$  mice were severely immunodeficient, and Bcl10  $-/-$  lymphocytes were defective in antigen receptor or phorbol myristate acetate (PMA)/ionomycin-induced activation. Early tyrosine phosphorylation, mitogen-activated protein kinase (MAPK; OMIM Ref. No. 604921) and activator protein-1

(AP1; 165160) activation, and calcium signaling were normal in mutant lymphocytes, but antigen receptor-induced NFkB activation was absent. Thus, the authors concluded that BCL10 functions as a positive regulator of lymphocyte proliferation that specifically connects antigen receptor signaling in B and T cells to NFkB activation.

[20551] It is appreciated that the abovementioned animal model for BCL10 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[20552] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20553] Willis, T. G.; Jadayel, D. M.; Du, M.-Q.; Peng, H.; Perry, A. R.; Abdul-Rauf, M.; Price, H.; Karran, L.; Majekodunmi, O.; Wlodarska, I.; Pan, L.; Crook, T.; Hamoudi, R.; Isaacson, P. G.; Dyer, M. J. S. : Bcl10 is involved in t(1;14)(p22;q32) of MALT B cell lymphoma and mutated in multiple tumor types Cell 96: 35-45, 1999. ; and

[20554] Ruland, J.; Duncan, G. S.; Elia, A.; del Barco Barrantes, I.; Nguyen, L.; Plyte, S.; Millar, D. G.; Bouchard, D.; Wakeham, A.; Ohashi, P. S.; Mak, T. W. : Bcl10 is a positive regulator.

[20555] Further studies establishing the function and utilities of

BCL10 are found in John Hopkins OMIM database record ID 603517, and in cited publications numbered 11497–8668 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Leucine–zipper–like Transcriptional Regulator, 1 (LZTR1, Accession NM\_006767) is another VGAM433 host target gene. LZTR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LZTR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LZTR1 BINDING SITE, designated SEQ ID:13642, to the nucleotide sequence of VGAM433 RNA, herein designated VGAM RNA, also designated SEQ ID:3144.

[20556] Another function of VGAM433 is therefore inhibition of Leucine–zipper–like Transcriptional Regulator, 1 (LZTR1, Accession NM\_006767). Accordingly, utilities of VGAM433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LZTR1. Protocadherin 11 X-linked (PCDH11X, Accession NM\_032968) is another VGAM433 host target gene. PCDH11X BINDING SITE1 and PCDH11X BINDING SITE2 are HOST TARGET

binding sites found in untranslated regions of mRNA encoded by PCDH11X, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH11X BINDING SITE1 and PCDH11X BINDING SITE2, designated SEQ ID:26793 and SEQ ID:26808 respectively, to the nucleotide sequence of VGAM433 RNA, herein designated VGAM RNA, also designated SEQ ID:3144.

[20557] Another function of VGAM433 is therefore inhibition of Protocadherin 11 X-linked (PCDH11X, Accession NM\_032968), a gene which is thought to play a fundamental role in cell-cell recognition essential for the segmental development and function of the central nervous system. Accordingly, utilities of VGAM433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH11X. The function of PCDH11X has been established by previous studies. The protocadherins are a subfamily of calcium-dependent cell adhesion and recognition proteins of the cadherin superfamily. They are particularly prevalent in the central nervous system. By database searching with a human PCDH7 (OMIM Ref. No. 602988) cDNA probe, Yoshida and Sugano

(1999) identified a homologous mRNA from infant brain. They found the same sequence on a genomic clone of chromosome X, within the X–Y homology region at Xp21.3. By RT–PCR using fetal brain, they identified a cDNA, PCDH11, which they called PCDHX, encoding a deduced 1,021–amino acid protein. Sequence analysis predicted a 25–amino acid signal peptide, an extracellular portion with 7 cadherin repeats, a 24–amino acid trans–membrane stretch, and a 10–amino acid cytoplasmic domain with homology to PCDH1 (OMIM Ref. No. 603626) and PCDH7. Yoshida and Sugano (1999) also identified a splice variant, termed PCDHXb, by EST database searches. Northern blot analysis revealed expression of an approximately 6.0–kb transcript in human and mouse fetal brain. Using STS analysis, Yoshida and Sugano (1999) mapped the PCDH11 gene to the X–Y homology region at chromosome Xq21.3 that is homologous to Yp11.1. Blanco et al. (2000) mapped the PCDH11 gene to Xq21.3, within the X–Y homologous region, using detailed YAC and PAC contigs and fine STS marker order.

[20558] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [20559] Yoshida, K.; Sugano, S. : Identification of a novel proto-cadherin gene (PCDH11) on the human XY homology region in Xq21.3. Genomics 62: 540–543, 1999. ; and
- [20560] Yoshida, K.; Sugano, S. : Identification of a novel proto-cadherin gene (PCDH11) on the human XY homology region in Xq21.3. Genomics 62: 540–543, 1999.
- [20561] Further studies establishing the function and utilities of PCDH11X are found in John Hopkins OMIM database record ID 300246, and in cited publications numbered 9161–916 and 9178 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RAB1A, Member RAS Oncogene Family (RAB1A, Accession XM\_046674) is another VGAM433 host target gene. RAB1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB1A BINDING SITE, designated SEQ ID:34791, to the nucleotide sequence of VGAM433 RNA, herein designated VGAM RNA, also designated SEQ ID:3144.
- [20562] Another function of VGAM433 is therefore inhibition of

RAB1A, Member RAS Oncogene Family (RAB1A, Accession XM\_046674), a gene which is involved in vesicle transport. Accordingly, utilities of VGAM433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB1A. The function of RAB1A has been established by previous studies. RAB proteins have been postulated to regulate the targeting and fusion of membranous vesicles during organelle assembly and transport. RAB proteins undergo regulated exchange of GTP for GDP, and they slowly hydrolyze the bound GTP in a reaction that is thought to regulate the timing and unidirectional nature of these assembly events. All of the known RAB proteins terminate in sequences such as cys-X-cys (e.g., RAB3A, 179490), cys-cys (e.g., RAB1A), or a closely related sequence, and all are believed to be geranylgeranylated. From a human pheochromocytoma cDNA library, Zahraoui et al. (1989) isolated 7 cDNA clones corresponding to genes encoding the Ras-associated GTP-binding proteins. See RAB5A (OMIM Ref. No. 179512). The predicted 205-amino acid human and rat RAB1 proteins are identical and share 75% identity with YPT1, the *S. cerevisiae* homolog. Northern blot analysis revealed that the RAB1 gene was expressed as a major (OMIM Ref. No. 2.7

kb) and a minor (OMIM Ref. No. 1.7 kb) mRNA in a human fibroblast cell line. The 'wobbler' spinal muscular atrophy gene (wr) maps to proximal mouse chromosome 11, tightly linked to Rab1 and Glns-ps1, an intronless pseudogene of the glutamine synthetase gene (OMIM Ref. No. 138290). Wedemeyer et al. (1996) used these markers to construct a 1.3-Mb YAC contig of the Rab1 region on mouse chromosome 11. Two overlapping YACS were identified that contained a 150-kb region of human chromosome 2p, comprising the RAB1 locus as well as a newly discovered STS (OMIM Ref. No. AHY1.1) and a trapped exon (OMIM Ref. No. ETG1.1). The region was mapped to 2p14-p13.4 using somatic cell hybrids and a radiation hybrid panel, thus extending a known region of conserved synteny between mouse chromosome 11 and human 2p. The gene for limb-girdle muscular dystrophy type 2B (LGMD2B; 253601) maps to 2p16-p13. The authors noted that conservation between the mouse Rab1 and human RAB1 regions will be helpful in identifying candidate genes for the 'wobbler' spinal muscular atrophy and in clarifying a possible relationship between wr and LGMD2B.

[20563] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [20564] Allan, B. B.; Moyer, B. D.; Balch, W. E. : Rab1 recruitment of p115 into a cis-SNARE complex: programming budding COPII vesicles for fusion. Science 289: 444-448, 2000. ; and
- [20565] Wedemeyer, N.; Lengeling, A.; Ronsiek, M.; Korthaus, D.; Baer, K.; Wuttke, M.; Jockusch, H. : YAC contigs of the Rab1 and wobbler (wr) spinal muscular atrophy gene region on proximal mo.
- [20566] Further studies establishing the function and utilities of RAB1A are found in John Hopkins OMIM database record ID 179508, and in cited publications numbered 2537-253 and 2722 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Thromboxane A2 Receptor (TBXA2R, Accession NM\_001060) is another VGAM433 host target gene. TBXA2R BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TBXA2R, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBXA2R BINDING SITE, designated SEQ ID:6727, to the nucleotide sequence of VGAM433 RNA,

herein designated VGAM RNA, also designated SEQ ID:3144.

[20567] Another function of VGAM433 is therefore inhibition of Thromboxane A2 Receptor (TBXA2R, Accession NM\_001060), a gene which activates  $\text{Ca}^{2+}$ -activated chloride channels; stimulates platelet aggregation and smooth muscle constriction. Accordingly, utilities of VGAM433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBXA2R. The function of TBXA2R has been established by previous studies. Thromboxane A2 (TXA2), an arachidonate metabolite, is a potent stimulator of platelet aggregation and a constrictor of vascular and respiratory smooth muscles. It has been implicated as a mediator in diseases such as myocardial infarction, stroke, and bronchial asthma. Ushikubi et al. (1989) purified the cell surface receptor for TXA2, using a stable analog of TXA2. Using an oligonucleotide probe corresponding to its partial amino acid sequence, Hirata et al. (1991) obtained a cDNA encoding the receptor from human placenta and a partial cDNA clone from cultured human megakaryocytic leukemia cells. The placenta cDNA encoded a protein of 343 amino acids with 7 putative transmembrane domains. The protein ex-

pressed in COS-7 cells bound drugs with affinities identical to those of the platelet receptor, and that expressed in *Xenopus* oocytes opened calcium-ion-activated chloride channels on agonist stimulation. Northern blot analysis and nucleotide sequences of the 2 clones suggested that an identical form of thromboxane A<sub>2</sub> receptor is present in platelets and vascular tissues. Animal model experiments lend further support to the function of TBXA<sub>2</sub>R. The actions of TXA<sub>2</sub> are mediated by G protein-coupled thromboxane-prostanoid (TP) receptors. TP receptors have been implicated in the pathogenesis of cardiovascular diseases. To investigate the physiologic functions of TP receptors, Thomas et al. (1998) generated TP receptor-deficient mice by gene targeting. *Tp* <sup>-/-</sup> animals reproduced and survived in expected numbers, and their major organ systems were normal. Thromboxane agonist binding could not be detected in tissues from *Tp* <sup>-/-</sup> mice. Bleeding times were prolonged in these mice and their platelets did not aggregate after exposure to TXA<sub>2</sub> agonists. Aggregation responses after collagen stimulation were also delayed, although ADP-stimulated aggregation was normal. In summary, *Tp* <sup>-/-</sup> mice had a mild bleeding disorder and altered vascular responses to TXA<sub>2</sub> and

arachidonic acid. Their studies suggested that most of the recognized functions of TXA2 are mediated by the single known Tp gene locus.

[20568] It is appreciated that the abovementioned animal model for TBXA2R is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[20569] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20570] Hirata, M.; Hayashi, Y.; Ushikubi, F.; Yokota, Y.; Kageyama, R.; Nakanishi, S.; Narumiya, S. : Cloning and expression of cDNA for a human thromboxane A2 receptor. Nature 349: 617-620, 1991. ; and

[20571] Thomas, D. W.; Mannon, R. B.; Mannon, P. J.; Latour, A.; Oliver, J. A.; Hoffman, M.; Smithies, O.; Koller, B. H.; Coffman, T. M. : Coagulation defects and altered hemodynamic responses.

[20572] Further studies establishing the function and utilities of TBXA2R are found in John Hopkins OMIM database record ID 188070, and in sited publications numbered 9654, 10839-9657, 9678-9679, 10598, 1084 and 9684-9683 listed in the bibliography section hereinbelow, which are

also hereby incorporated by reference. Chromosome 21 Open Reading Frame 18 (C21orf18, Accession NM\_017438) is another VGAM433 host target gene. C21orf18 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C21orf18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf18 BINDING SITE, designated SEQ ID:18898, to the nucleotide sequence of VGAM433 RNA, herein designated VGAM RNA, also designated SEQ ID:3144.

[20573] Another function of VGAM433 is therefore inhibition of Chromosome 21 Open Reading Frame 18 (C21orf18, Accession NM\_017438). Accordingly, utilities of VGAM433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf18. Caspase 9, Apoptosis-related Cysteine Protease (CASP9, Accession NM\_001229) is another VGAM433 host target gene. CASP9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CASP9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of CASP9 BINDING SITE, designated SEQ ID:6899, to the nucleotide sequence of VGAM433 RNA, herein designated VGAM RNA, also designated SEQ ID:3144.

[20574] Another function of VGAM433 is therefore inhibition of Caspase 9, Apoptosis-related Cysteine Protease (CASP9, Accession NM\_001229). Accordingly, utilities of VGAM433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASP9. FLJ20813 (Accession NM\_017961) is another VGAM433 host target gene. FLJ20813 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20813, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20813 BINDING SITE, designated SEQ ID:19680, to the nucleotide sequence of VGAM433 RNA, herein designated VGAM RNA, also designated SEQ ID:3144.

[20575] Another function of VGAM433 is therefore inhibition of FLJ20813 (Accession NM\_017961). Accordingly, utilities of VGAM433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20813.

G Protein-coupled Receptor 64 (GPR64, Accession NM\_005756) is another VGAM433 host target gene. GPR64 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPR64, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR64 BINDING SITE, designated SEQ ID:12316, to the nucleotide sequence of VGAM433 RNA, herein designated VGAM RNA, also designated SEQ ID:3144.

[20576] Another function of VGAM433 is therefore inhibition of G Protein-coupled Receptor 64 (GPR64, Accession NM\_005756). Accordingly, utilities of VGAM433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR64. HTGN29 (Accession NM\_020199) is another VGAM433 host target gene. HTGN29 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HTGN29, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTGN29 BINDING SITE, designated SEQ

ID:21433, to the nucleotide sequence of VGAM433 RNA, herein designated VGAM RNA, also designated SEQ ID:3144.

[20577] Another function of VGAM433 is therefore inhibition of HTGN29 (Accession NM\_020199). Accordingly, utilities of VGAM433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTGN29. KIAA0352 (Accession NM\_014830) is another VGAM433 host target gene. KIAA0352 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0352, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0352 BINDING SITE, designated SEQ ID:16827, to the nucleotide sequence of VGAM433 RNA, herein designated VGAM RNA, also designated SEQ ID:3144.

[20578] Another function of VGAM433 is therefore inhibition of KIAA0352 (Accession NM\_014830). Accordingly, utilities of VGAM433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0352. KIAA0757 (Accession NM\_006038) is another VGAM433 host target gene. KIAA0757 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0757, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0757 BINDING SITE, designated SEQ ID:12672, to the nucleotide sequence of VGAM433 RNA, herein designated VGAM RNA, also designated SEQ ID:3144.

[20579] Another function of VGAM433 is therefore inhibition of KIAA0757 (Accession NM\_006038). Accordingly, utilities of VGAM433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0757. KIAA1796 (Accession XM\_166146) is another VGAM433 host target gene. KIAA1796 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1796, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1796 BINDING SITE, designated SEQ ID:43967, to the nucleotide sequence of VGAM433 RNA, herein designated VGAM RNA, also designated SEQ ID:3144.

[20580] Another function of VGAM433 is therefore inhibition of

KIAA1796 (Accession XM\_166146). Accordingly, utilities of VGAM433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1796. RNO2 (Accession NM\_033297) is another VGAM433 host target gene. RNO2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RNO2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNO2 BINDING SITE, designated SEQ ID:27127, to the nucleotide sequence of VGAM433 RNA, herein designated VGAM RNA, also designated SEQ ID:3144.

[20581] Another function of VGAM433 is therefore inhibition of RNO2 (Accession NM\_033297). Accordingly, utilities of VGAM433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNO2. Zinc Finger Protein 17 (HPF3, KOX 10) (ZNF17, Accession XM\_091895) is another VGAM433 host target gene. ZNF17 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF17, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of ZNF17 BINDING SITE, designated SEQ ID:40066, to the nucleotide sequence of VGAM433 RNA, herein designated VGAM RNA, also designated SEQ ID:3144.

[20582] Another function of VGAM433 is therefore inhibition of Zinc Finger Protein 17 (HPF3, KOX 10) (ZNF17, Accession XM\_091895). Accordingly, utilities of VGAM433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF17. LOC145601 (Accession XM\_096816) is another VGAM433 host target gene. LOC145601 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145601, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145601 BINDING SITE, designated SEQ ID:40540, to the nucleotide sequence of VGAM433 RNA, herein designated VGAM RNA, also designated SEQ ID:3144.

[20583] Another function of VGAM433 is therefore inhibition of LOC145601 (Accession XM\_096816). Accordingly, utilities of VGAM433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC145601. LOC155340 (Accession XM\_055725) is another VGAM433 host target gene. LOC155340 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC155340, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155340 BINDING SITE, designated SEQ ID:36319, to the nucleotide sequence of VGAM433 RNA, herein designated VGAM RNA, also designated SEQ ID:3144.

[20584] Another function of VGAM433 is therefore inhibition of LOC155340 (Accession XM\_055725). Accordingly, utilities of VGAM433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155340. LOC256598 (Accession XM\_172816) is another VGAM433 host target gene. LOC256598 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256598, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256598 BINDING SITE, designated SEQ ID:46099, to the nucleotide sequence of VGAM433 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3144.

[20585] Another function of VGAM433 is therefore inhibition of LOC256598 (Accession XM\_172816). Accordingly, utilities of VGAM433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256598. LOC257463 (Accession XM\_048605) is another VGAM433 host target gene. LOC257463 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257463 BINDING SITE, designated SEQ ID:35207, to the nucleotide sequence of VGAM433 RNA, herein designated VGAM RNA, also designated SEQ ID:3144.

[20586] Another function of VGAM433 is therefore inhibition of LOC257463 (Accession XM\_048605). Accordingly, utilities of VGAM433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257463. LOC83693 (Accession NM\_031463) is another VGAM433 host target gene. LOC83693 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC83693, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC83693 BINDING SITE, designated SEQ ID:25497, to the nucleotide sequence of VGAM433 RNA, herein designated VGAM RNA, also designated SEQ ID:3144.

[20587] Another function of VGAM433 is therefore inhibition of LOC83693 (Accession NM\_031463). Accordingly, utilities of VGAM433 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC83693. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 434 (VGAM434) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20588] VGAM434 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM434 was detected is described hereinabove with reference to Figs. 1–8.

[20589] VGAM434 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sendai Virus. VGAM434

host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20590] VGAM434 gene encodes a VGAM434 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM434 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM434 precursor RNA is designated SEQ ID:420, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:420 is located at position 14005 relative to the genome of Sendai Virus.

[20591] VGAM434 precursor RNA folds onto itself, forming VGAM434 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20592] An enzyme complex designated DICER COMPLEX, `dices` the VGAM434 folded precursor RNA into VGAM434 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM434 RNA is designated SEQ ID:3145, and is provided hereinbelow with reference to the sequence listing part.

[20593] VGAM434 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM434 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM434 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[20594] VGAM434 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM434 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM434 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM434 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM434 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[20595] The complementary binding of VGAM434 RNA, herein designated VGAM RNA, to host target binding sites on VGAM434 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM434 host target RNA into VGAM434 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[20596] It is appreciated that VGAM434 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM434 host target genes. The mRNA of each one of this plurality of VGAM434 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM434 RNA, herein designated VGAM RNA, and which when bound by VGAM434 RNA causes inhibition of translation of respective one or more VGAM434 host target proteins.

[20597] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM434 gene, herein designated VGAM GENE, on one or more VGAM434 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[20598] It is yet further appreciated that a function of VGAM434 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM434 include diagnosis, prevention and treatment of viral infection by Sendai Virus. Specific functions, and accordingly utilities, of VGAM434 correlate with, and may be deduced from, the identity of the host target genes which VGAM434 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20599] Nucleotide sequences of the VGAM434 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM434 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM434 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM434 are further described hereinbelow with reference to Table 1.

[20600] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM434 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM434 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20601] As mentioned hereinabove with reference to Fig. 1, a function of VGAM434 gene, herein designated VGAM is inhibition of expression of VGAM434 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM434 correlate with, and may be deduced from, the identity of the target genes which VGAM434 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20602] KIAA0441 (Accession NM\_014797) is a VGAM434 host target gene. KIAA0441 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0441, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0441 BINDING SITE, designated SEQ ID:16712, to the nucleotide sequence of VGAM434 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:3145.

[20603] A function of VGAM434 is therefore inhibition of KIAA0441 (Accession NM\_014797). Accordingly, utilities of VGAM434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0441. KIAA0555 (Accession NM\_014790) is another VGAM434 host target gene. KIAA0555 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0555, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0555 BINDING SITE, designated SEQ ID:16679, to the nucleotide sequence of VGAM434 RNA, herein designated VGAM RNA, also designated SEQ ID:3145.

[20604] Another function of VGAM434 is therefore inhibition of KIAA0555 (Accession NM\_014790). Accordingly, utilities of VGAM434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0555. Rab11-FIP2 (Accession NM\_014904) is another VGAM434 host target gene. Rab11-FIP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Rab11-FIP2, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Rab11-FIP2 BINDING SITE, designated SEQ ID:17103, to the nucleotide sequence of VGAM434 RNA, herein designated VGAM RNA, also designated SEQ ID:3145.

[20605] Another function of VGAM434 is therefore inhibition of Rab11-FIP2 (Accession NM\_014904). Accordingly, utilities of VGAM434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Rab11-FIP2. LOC152992 (Accession XM\_087575) is another VGAM434 host target gene. LOC152992 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152992, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152992 BINDING SITE, designated SEQ ID:39348, to the nucleotide sequence of VGAM434 RNA, herein designated VGAM RNA, also designated SEQ ID:3145.

[20606] Another function of VGAM434 is therefore inhibition of LOC152992 (Accession XM\_087575). Accordingly, utilities of VGAM434 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC152992. LOC221830 (Accession XM\_166508) is another VGAM434 host target gene. LOC221830 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221830, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221830 BINDING SITE, designated SEQ ID:44438, to the nucleotide sequence of VGAM434 RNA, herein designated VGAM RNA, also designated SEQ ID:3145.

[20607] Another function of VGAM434 is therefore inhibition of LOC221830 (Accession XM\_166508). Accordingly, utilities of VGAM434 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221830. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 435 (VGAM435) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20608] VGAM435 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM435 was detected is described hereinabove with reference to Figs. 1–8.

[20609] VGAM435 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sendai Virus. VGAM435 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20610] VGAM435 gene encodes a VGAM435 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM435 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM435 precursor RNA is designated SEQ ID:421, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:421 is located at position 11483 relative to the genome of Sendai Virus.

[20611] VGAM435 precursor RNA folds onto itself, forming VGAM435 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20612] An enzyme complex designated DICER COMPLEX, `dices` the VGAM435 folded precursor RNA into VGAM435 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 57%) nucleotide sequence of VGAM435 RNA is designated SEQ ID:3146, and is provided hereinbelow with reference to the sequence listing part.

[20613] VGAM435 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM435 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM435 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[20614] VGAM435 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM435 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM435 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM435 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM435 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[20615] The complementary binding of VGAM435 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM435 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM435 host target RNA into VGAM435 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20616] It is appreciated that VGAM435 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM435 host target genes. The mRNA of each one of this plurality of VGAM435 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM435 RNA, herein designated VGAM RNA, and which when bound by VGAM435 RNA causes inhibition of translation of respective one or more VGAM435 host target proteins.

[20617] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM435 gene, herein designated VGAM GENE, on one or more VGAM435 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[20618] It is yet further appreciated that a function of VGAM435 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM435 include diagnosis, prevention and treatment of viral infection by Sendai Virus. Specific functions, and accordingly utilities, of VGAM435 correlate with, and may be deduced from, the identity of the host target genes which VGAM435 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20619] Nucleotide sequences of the VGAM435 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM435 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM435 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM435 are further described hereinbelow with reference to Table 1.

[20620] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM435 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM435 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20621] As mentioned hereinabove with reference to Fig. 1, a function of VGAM435 gene, herein designated VGAM is inhibition of expression of VGAM435 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM435 correlate with, and may be deduced from, the identity of the target genes which VGAM435 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20622] Rho GDP Dissociation Inhibitor (GDI) Alpha (ARHGDIA, Accession NM\_004309) is a VGAM435 host target gene. ARHGDIA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

ARHGDIA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGDIA BINDING SITE, designated SEQ ID:10514, to the nucleotide sequence of VGAM435 RNA, herein designated VGAM RNA, also designated SEQ ID:3146.

[20623] A function of VGAM435 is therefore inhibition of Rho GDP Dissociation Inhibitor (GDI) Alpha (ARHGDIA, Accession NM\_004309), a gene which is a small guanine nucleotide exchange (GTP/GDP) factor. Accordingly, utilities of VGAM435 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGDIA. The function of ARHGDIA has been established by previous studies. Ras-related homologs (ARHs), also called Rho genes, belong to the RAS gene superfamily encoding small guanine nucleotide exchange (GTP/GDP) factors. The ARH proteins may be kept in the inactive, GDP-bound state by interaction with GDP dissociation inhibitors (GDIAs). By screening a transformed amnion cell library with an ARHGDIB (OMIM Ref. No. 602843) cDNA, Leffers et al. (1993) isolated cDNAs encoding ARHGDIA. They found that ARHGDIA corresponded to a protein in the ker-

atinocyte 2-dimensional-gel protein database known as IEF (isoelectric focusing) 8118. By 2-dimensional gel electrophoresis, the predicted 204-amino acid protein had a pI of 4.74 and migrated at 29 kD. The amino acid sequences of human and bovine ARHGDIA are 97% identical. Leffers et al. (1993) found that the ARHGDIA gene contains 6 exons. Northern blot analysis revealed that ARHGDIA was expressed in all cell lines and tissues tested. Overexpression of ARHGDIB in mammalian cells caused them to 'round up' and disrupted the actin cytoskeleton, mimicking the phenotypic changes associated with inactivation of Rho proteins. Wagner et al. (1997) demonstrated by fluorescence in situ hybridization that the GDIA1 gene maps to 17q25.3. The assignment was confirmed by the use of a new somatic cell hybrid panel for 17q.

[20624] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20625] Leffers, H.; Nielsen, M. S.; Andersen, A. H.; Honore, B.; Madsen, P.; Vandekerckhove, J.; Celis, J. E. : Identification of two human rho GDP dissociation inhibitor proteins whose overexpression leads to disruption of the actin cytoskeleton. *Exp. Cell Res.* 209: 165–174, 1993. ; and

[20626] Wagner, T.; Tommerup, N.; Wirth, J.; Leffers, H.; Zimmer, J.; Back, E.; Weissenbach, J.; Scherer, G. : A somatic cell hybrid panel for distal 17q: GDIA1 maps to 17q25.3. Cytogenet. Cell.

[20627] Further studies establishing the function and utilities of ARHGDIA are found in John Hopkins OMIM database record ID 601925, and in cited publications numbered 5814–5815 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Corticotropin Releasing Hormone Receptor 1 (CRHR1, Accession NM\_004382) is another VGAM435 host target gene. CRHR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CRHR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRHR1 BINDING SITE, designated SEQ ID:10607, to the nucleotide sequence of VGAM435 RNA, herein designated VGAM RNA, also designated SEQ ID:3146.

[20628] Another function of VGAM435 is therefore inhibition of Corticotropin Releasing Hormone Receptor 1 (CRHR1, Accession NM\_004382), a gene which likely mediates physi-

ological and behavioral response to stress. Accordingly, utilities of VGAM435 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRHR1. The function of CRHR1 has been established by previous studies. Grammatopoulos et al. (1998) studied the expression of CRHR1 in human myometrium. They used RT-PCR, fluorescence in situ hybridization, and immunofluorescence to identify and localize the 4 subtypes, 1-alpha, 1-beta, 2-alpha, and the variant C, of CRHR1. The CRHR1 subtypes in myometrium exhibited differential expression patterns; in human pregnant myometrium at term, all 4 receptor subtypes were expressed, whereas only the 1-alpha and 1-beta receptor subtypes were found in the nonpregnant myometrium. The authors concluded that CRHR1 acting via different receptor subtypes is able to exert different actions on the myometrium in the pregnant state compared to the nonpregnant state. Furthermore, in the pregnant human uterus, receptors were localized in both smooth muscle and fibroblasts, suggesting that CRHR1 expression plays an important modulatory role in myometrial and possibly in cervical function. Leproult et al. (2001) examined the effects of bright light on the profiles of hormones known to be af-

affected by sleep deprivation (TSH; OMIM Ref. No. 188540) or involved in behavioral activation (cortisol). The early morning transition from dim to bright light suppressed melatonin secretion, induced an immediate, greater than 50% elevation of cortisol levels, and limited the deterioration of alertness normally associated with overnight sleep deprivation. No effect was detected on TSH profiles. The authors concluded that these data unambiguously demonstrate an effect of light on the corticotropic axis that is dependent on time of day. Animal model experiments lend further support to the function of CRHR1. Sillaber et al. (2002) studied *Crhr1*  $-/-$  mice generated by Timpl et al. (1998). In homozygous mutant mice, stress leads to enhanced and progressively increasing alcohol intake. The effect of repeated stress on alcohol drinking behavior appeared with a delay and persisted throughout life. It was associated with an upregulation of the N-methyl-D-aspartate receptor subunit NR2B (OMIM Ref. No. 138252). Sillaber et al. (2002) concluded that alterations in the CRHR1 gene and adaptional changes in NR2B subunits may constitute a genetic risk factor for stress-induced alcohol drinking and alcoholism.

[20629] It is appreciated that the abovementioned animal model

for CRHR1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[20630] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20631] Leproult, R.; Colecchia, E. F.; L'Hermite-Baleriaux, M.; Van Cauter, E. : Transition from dim to bright light in the morning induces an immediate elevation of cortisol levels. J. Clin. Endocr. Metab. 86: 151–157, 2001. ; and

[20633] Further studies establishing the function and utilities of CRHR1 are found in John Hopkins OMIM database record ID 122561, and in cited publications numbered 2034–1988, 264 and 2660–2663 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. C-myc Binding Protein (MYCBP, Accession NM\_012333) is another VGAM435 host target gene. MYCBP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MY-

CBP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYCBP BINDING SITE, designated SEQ ID:14723, to the nucleotide sequence of VGAM435 RNA, herein designated VGAM RNA, also designated SEQ ID:3146.

[20634] Another function of VGAM435 is therefore inhibition of C-myc Binding Protein (MYCBP, Accession NM\_012333), a gene which binds c-Myc stimulating the activation of E-box-dependent transcription. Accordingly, utilities of VGAM435 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYCBP. The function of MYCBP has been established by previous studies. To assess the molecular function of MYC-binding protein, Furusawa et al. (2001) performed a 2-hybrid screening of cDNAs encoding AMY1-binding proteins, with AMY1 as a bait using a human HeLa cDNA library. They found a clone encoding AKAP149 (AKAP1; 602449). AMY1 was found to bind in vitro and in vivo to the regulatory subunit II-binding region of AKAP1 and S-AKAP84, a splicing variant of AKAP149 expressed in the testis. AMY1 was expressed postmeiotically in the testis, as was also S-

AKAP84. AMY1 was localized in the mitochondria of HeLa and sperm in association with AKAP149 and S-AKAP84, respectively. These results suggested that AMY1 plays a role in spermatogenesis.

[20635] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20636] Furusawa, M.; Ohnishi, T.; Taira, T.; Iguchi-Ariga, S. M. M.; Ariga, H. : AMY-1, a c-Myc-binding protein, is localized in the mitochondria of sperm by association with S-AKAP84, an anchor protein of cAMP-dependent protein kinase. J. Biol. Chem. 276: 36647-36651, 2001. ; and

[20637] Taira, T.; Maeda, J.; Onishi, T.; Kitaura, H.; Yoshida, S.; Kato, H.; Ikeda, M.; Tamai, K.; Iguchi-Ariga, S. M. M.; Ariga, H. : AMY-1, a novel C-MYC binding protein that stimulates tra.

[20638] Further studies establishing the function and utilities of MYCBP are found in John Hopkins OMIM database record ID 606535, and in cited publications numbered 6466-6467 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein Phosphatase 2A, Regulatory Subunit B' (PR 53) (PPP2R4, Accession XM\_026944) is another VGAM435 host target

gene. PPP2R4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP2R4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP2R4 BINDING SITE, designated SEQ ID:30374, to the nucleotide sequence of VGAM435 RNA, herein designated VGAM RNA, also designated SEQ ID:3146.

[20639] Another function of VGAM435 is therefore inhibition of Protein Phosphatase 2A, Regulatory Subunit B' (PR 53) (PPP2R4, Accession XM\_026944), a gene which is a regulatory subunit of protein phosphatase 2A. Accordingly, utilities of VGAM435 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP2R4. The function of PPP2R4 has been established by previous studies. McCright et al. (1996) stated that PP2A contains a 36-kD catalytic C subunit (OMIM Ref. No. 176915) and a 65-kD structural/regulatory A subunit. Association of this dimeric core of PP2A with a third regulatory subunit (PR54, PR55, PR72, PR74, PR130, etc.) results in the formation of a specific trimeric holoenzyme. The PPP2R4 gene (which the authors symbolized PTPA) en-

codes a specific phosphotyrosyl phosphatase activator of the dimeric form of protein phosphatase 2A. Van Hoof et al. (1995) demonstrated that human PTPA is encoded by a single-copy gene composed of 10 exons and 9 introns with a total length of about 60 kb. The 5-prime flanking sequence of the transcription start site was analyzed for its potential as a promoter. This region lacks a TATA sequence in the appropriate position relative to the transcription start. However, this region is very GC-rich and contains four Sp1 sites (SP1; 189906) upstream of the transcription start site, a feature common to many TATA-less promoters. Based on homology with DNA-binding consensus sequences of transcription factors, Van Hoof et al. (1995) identified several additional putative transcription factor binding sites in the promoter region. Transfection experiments with a construct containing the PTPA promoter region inserted 5-prime of a luciferase reporter gene demonstrated that the 5-prime flanking sequence of the PTPA gene indeed has promoter activity that seems to be cell-line dependent. By fluorescence in situ hybridization, Van Hoof et al. (1995) mapped the PTPA gene to 9q34. Fluorescence in situ analysis of metaphase chromosomes of patients bearing the Philadelphia chromosome

indicated that PTPA is positioned centromeric of ABL1 (OMIM Ref. No. 189980) and probably is not involved in chronic myeloid leukemia.

[20640] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20641] McCright, B.; Rivers, A. M.; Audlin, S.; Virshup, D. M. : The B56 family of protein phosphatase 2A (PP2A) regulatory subunits encodes differentiation-induced phosphoproteins that target PP2A to both nucleus and cytoplasm. J. Biol. Chem. 271: 22081–22089, 1996. ; and

[20643] Further studies establishing the function and utilities of PPP2R4 are found in John Hopkins OMIM database record ID 600756, and in cited publications numbered 8305–8306 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 5 Open Reading Frame 4 (C5orf4, Accession NM\_032385) is another VGAM435 host target gene. C5orf4 BINDING SITE is HOST TARGET binding site

found in the 3` untranslated region of mRNA encoded by C5orf4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C5orf4 BINDING SITE, designated SEQ ID:26179, to the nucleotide sequence of VGAM435 RNA, herein designated VGAM RNA, also designated SEQ ID:3146.

[20644] Another function of VGAM435 is therefore inhibition of Chromosome 5 Open Reading Frame 4 (C5orf4, Accession NM\_032385). Accordingly, utilities of VGAM435 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf4. Dynein, Axonemal, Light Polypeptide 4 (DNAL4, Accession NM\_005740) is another VGAM435 host target gene. DNAL4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DNAL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNAL4 BINDING SITE, designated SEQ ID:12306, to the nucleotide sequence of VGAM435 RNA, herein designated VGAM RNA, also designated SEQ ID:3146.

[20645] Another function of VGAM435 is therefore inhibition of Dynein, Axonemal, Light Polypeptide 4 (DNAL4, Accession NM\_005740). Accordingly, utilities of VGAM435 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAL4. Huntingtin-associated Protein Interacting Protein (duo) (HAIP, Accession NM\_003947) is another VGAM435 host target gene. HAIP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HAIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HAIP BINDING SITE, designated SEQ ID:10067, to the nucleotide sequence of VGAM435 RNA, herein designated VGAM RNA, also designated SEQ ID:3146.

[20646] Another function of VGAM435 is therefore inhibition of Huntingtin-associated Protein Interacting Protein (duo) (HAIP, Accession NM\_003947). Accordingly, utilities of VGAM435 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HAIP. MGC15416 (Accession NM\_138418) is another VGAM435 host target gene. MGC15416 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of

mRNA encoded by MGC15416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15416 BINDING SITE, designated SEQ ID:28787, to the nucleotide sequence of VGAM435 RNA, herein designated VGAM RNA, also designated SEQ ID:3146.

[20647] Another function of VGAM435 is therefore inhibition of MGC15416 (Accession NM\_138418). Accordingly, utilities of VGAM435 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15416. Solute Carrier Family 25, (mitochondrial carrier), Member 18 (SLC25A18, Accession NM\_031481) is another VGAM435 host target gene. SLC25A18 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC25A18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC25A18 BINDING SITE, designated SEQ ID:25561, to the nucleotide sequence of VGAM435 RNA, herein designated VGAM RNA, also designated SEQ ID:3146.

[20648] Another function of VGAM435 is therefore inhibition of

Solute Carrier Family 25, (mitochondrial carrier), Member 18 (SLC25A18, Accession NM\_031481). Accordingly, utilities of VGAM435 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC25A18. Solute Carrier Family 39 (zinc transporter), Member 3 (SLC39A3, Accession NM\_144564) is another VGAM435 host target gene. SLC39A3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC39A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC39A3 BINDING SITE, designated SEQ ID:29356, to the nucleotide sequence of VGAM435 RNA, herein designated VGAM RNA, also designated SEQ ID:3146.

[20649] Another function of VGAM435 is therefore inhibition of Solute Carrier Family 39 (zinc transporter), Member 3 (SLC39A3, Accession NM\_144564). Accordingly, utilities of VGAM435 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC39A3. LOC127534 (Accession XM\_060532) is another VGAM435 host target gene. LOC127534 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of

mRNA encoded by LOC127534, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127534 BINDING SITE, designated SEQ ID:37165, to the nucleotide sequence of VGAM435 RNA, herein designated VGAM RNA, also designated SEQ ID:3146.

[20650] Another function of VGAM435 is therefore inhibition of LOC127534 (Accession XM\_060532). Accordingly, utilities of VGAM435 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127534. LOC132617 (Accession XM\_067939) is another VGAM435 host target gene. LOC132617 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC132617, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC132617 BINDING SITE, designated SEQ ID:37370, to the nucleotide sequence of VGAM435 RNA, herein designated VGAM RNA, also designated SEQ ID:3146.

[20651] Another function of VGAM435 is therefore inhibition of LOC132617 (Accession XM\_067939). Accordingly, utilities

of VGAM435 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132617. LOC91040 (Accession XM\_035641) is another VGAM435 host target gene. LOC91040 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91040 BINDING SITE, designated SEQ ID:32314, to the nucleotide sequence of VGAM435 RNA, herein designated VGAM RNA, also designated SEQ ID:3146.

[20652] Another function of VGAM435 is therefore inhibition of LOC91040 (Accession XM\_035641). Accordingly, utilities of VGAM435 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91040. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 436 (VGAM436) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20653] VGAM436 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM436 was detected is described hereinabove with reference to Figs. 1–8.

[20654] VGAM436 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Sendai Virus. VGAM436 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20655] VGAM436 gene encodes a VGAM436 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM436 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM436 precursor RNA is designated SEQ ID:422, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:422 is located at position 14126 relative to the genome of Sendai Virus.

[20656] VGAM436 precursor RNA folds onto itself, forming VGAM436 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20657] An enzyme complex designated DICER COMPLEX, `dices` the VGAM436 folded precursor RNA into VGAM436 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM436 RNA is designated SEQ ID:3147, and is provided hereinbelow with reference to the sequence listing part.

[20658] VGAM436 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM436 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM436 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[20659] VGAM436 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM436 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM436 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM436 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM436 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[20660] The complementary binding of VGAM436 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM436 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM436 host target RNA into VGAM436 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20661] It is appreciated that VGAM436 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM436 host target genes. The mRNA of each one of this plurality of VGAM436 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM436 RNA, herein designated VGAM RNA, and which when bound by VGAM436 RNA causes inhibition of translation of respective one or more VGAM436 host target proteins.

[20662] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM436 gene, herein designated VGAM GENE, on one or more VGAM436 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[20663] It is yet further appreciated that a function of VGAM436 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM436 include diagnosis, prevention and treatment of viral infection by Sendai Virus. Specific functions, and accordingly utilities, of VGAM436 correlate with, and may be deduced from, the identity of the host target genes which VGAM436 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20664] Nucleotide sequences of the VGAM436 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

5' duced 5' VGAM436 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM436 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM436 are further described hereinbelow with reference to Table 1.

[20665] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM436 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM436 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20666] As mentioned hereinabove with reference to Fig. 1, a function of VGAM436 gene, herein designated VGAM is inhibition of expression of VGAM436 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM436 correlate with, and may be deduced from, the identity of the target genes which VGAM436 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20667] PAG (Accession NM\_018440) is a VGAM436 host target gene. PAG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

PAG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAG BINDING SITE, designated SEQ ID:20508, to the nucleotide sequence of VGAM436 RNA, herein designated VGAM RNA, also designated SEQ ID:3147.

[20668] A function of VGAM436 is therefore inhibition of PAG (Accession NM\_018440). Accordingly, utilities of VGAM436 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAG. Chromosome 20 Open Reading Frame 50 (C20orf50, Accession XM\_046437) is another VGAM436 host target gene. C20orf50 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C20orf50, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf50 BINDING SITE, designated SEQ ID:34717, to the nucleotide sequence of VGAM436 RNA, herein designated VGAM RNA, also designated SEQ ID:3147.

[20669] Another function of VGAM436 is therefore inhibition of Chromosome 20 Open Reading Frame 50 (C20orf50, Ac-

cession XM\_046437). Accordingly, utilities of VGAM436 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf50.

KIAA1336 (Accession XM\_051306) is another VGAM436 host target gene. KIAA1336 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1336, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1336 BINDING SITE, designated SEQ ID:35802, to the nucleotide sequence of VGAM436 RNA, herein designated VGAM RNA, also designated SEQ ID:3147.

[20670] Another function of VGAM436 is therefore inhibition of KIAA1336 (Accession XM\_051306). Accordingly, utilities of VGAM436 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1336. PR Domain Containing 10 (PRDM10, Accession NM\_020228) is another VGAM436 host target gene. PRDM10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRDM10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of PRDM10 BINDING SITE, designated SEQ ID:21498, to the nucleotide sequence of VGAM436 RNA, herein designated VGAM RNA, also designated SEQ ID:3147.

[20671] Another function of VGAM436 is therefore inhibition of PR Domain Containing 10 (PRDM10, Accession NM\_020228). Accordingly, utilities of VGAM436 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDM10. Tuftelin Interacting Protein 11 (TFIP11, Accession NM\_012143) is another VGAM436 host target gene. TFIP11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TFIP11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TFIP11 BINDING SITE, designated SEQ ID:14450, to the nucleotide sequence of VGAM436 RNA, herein designated VGAM RNA, also designated SEQ ID:3147.

[20672] Another function of VGAM436 is therefore inhibition of Tuftelin Interacting Protein 11 (TFIP11, Accession NM\_012143). Accordingly, utilities of VGAM436 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with TFIP11. LOC158364 (Accession XM\_088546) is another VGAM436 host target gene. LOC158364 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC158364, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158364 BINDING SITE, designated SEQ ID:39814, to the nucleotide sequence of VGAM436 RNA, herein designated VGAM RNA, also designated SEQ ID:3147.

[20673] Another function of VGAM436 is therefore inhibition of LOC158364 (Accession XM\_088546). Accordingly, utilities of VGAM436 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158364. LOC253613 (Accession XM\_171225) is another VGAM436 host target gene. LOC253613 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC253613, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC253613 BINDING SITE, designated SEQ ID:46010, to the nucleotide sequence of VGAM436 RNA, herein designated VGAM RNA, also designated SEQ ID:3147.

[20674] Another function of VGAM436 is therefore inhibition of LOC253613 (Accession XM\_171225). Accordingly, utilities of VGAM436 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253613. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 437 (VGAM437) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20675] VGAM437 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM437 was detected is described hereinabove with reference to Figs. 1–8.

[20676] VGAM437 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tomato Bushy Stunt Virus. VGAM437 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20677] VGAM437 gene encodes a VGAM437 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM437 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM437 precursor RNA is designated SEQ ID:423, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:423 is located at position 3049 relative to the genome of Tomato Bushy Stunt Virus.

[20678] VGAM437 precursor RNA folds onto itself, forming VGAM437 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20679] An enzyme complex designated DICER COMPLEX, `dices` the VGAM437 folded precursor RNA into VGAM437 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM437 RNA is designated SEQ ID:3148, and is provided hereinbelow with reference to the sequence listing part.

[20680] VGAM437 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM437 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM437 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[20681] VGAM437 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM437 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM437 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM437 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM437 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[20682] The complementary binding of VGAM437 RNA, herein designated VGAM RNA, to host target binding sites on VGAM437 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM437 host target RNA into VGAM437 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20683] It is appreciated that VGAM437 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM437 host target genes. The mRNA of each one of this plurality of VGAM437 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM437 RNA, herein designated VGAM RNA, and which when bound by VGAM437 RNA causes inhibition of translation of respective one or more VGAM437 host target proteins.

[20684] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM437 gene, herein designated VGAM GENE, on one or more VGAM437 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,  
`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[20685] It is yet further appreciated that a function of VGAM437 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM437 include diagnosis, prevention and treatment of viral infection by Tomato Bushy Stunt Virus. Specific functions, and accordingly utilities, of VGAM437 correlate with, and may be deduced from, the identity of the host target genes which VGAM437 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20686] Nucleotide sequences of the VGAM437 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM437 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM437 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM437 are further described hereinbelow with reference to Table 1.

[20687] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM437 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM437 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20688] As mentioned hereinabove with reference to Fig. 1, a function of VGAM437 gene, herein designated VGAM is inhibition of expression of VGAM437 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM437 correlate with, and may be deduced from, the identity of the target genes which VGAM437 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20689] Sulfotransferase Family, Cytosolic, 1C, Member 1 (SULT1C1, Accession NM\_001056) is a VGAM437 host target gene. SULT1C1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SULT1C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SULT1C1 BINDING SITE, designated SEQ ID:6721, to the nucleotide sequence of VGAM437 RNA, herein designated VGAM RNA, also designated SEQ ID:3148.

[20690] A function of VGAM437 is therefore inhibition of Sulfo-transferase Family, Cytosolic, 1C, Member 1 (SULT1C1, Accession NM\_001056). Accordingly, utilities of VGAM437 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SULT1C1. HRIHFB2436 (Accession NM\_014345) is another VGAM437 host target gene. HRIHFB2436 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HRIHFB2436, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRIHFB2436 BINDING SITE, designated SEQ ID:15667, to the nucleotide sequence of VGAM437 RNA, herein designated VGAM RNA, also designated SEQ ID:3148.

[20691] Another function of VGAM437 is therefore inhibition of HRIHFB2436 (Accession NM\_014345). Accordingly, utilities of VGAM437 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRIHFB2436. LOC139065 (Accession XM\_066456) is another VGAM437 host target gene. LOC139065 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC139065, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC139065 BINDING SITE, designated SEQ ID:37327, to the nucleotide sequence of VGAM437 RNA, herein designated VGAM RNA, also designated SEQ ID:3148.

[20692] Another function of VGAM437 is therefore inhibition of LOC139065 (Accession XM\_066456). Accordingly, utilities of VGAM437 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139065. LOC151584 (Accession XM\_098089) is another VGAM437 host target gene. LOC151584 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151584, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151584 BINDING SITE, designated SEQ ID:41375, to the nucleotide sequence of VGAM437 RNA, herein designated VGAM RNA, also designated SEQ ID:3148.

[20693] Another function of VGAM437 is therefore inhibition of LOC151584 (Accession XM\_098089). Accordingly, utilities of VGAM437 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC151584. LOC222166 (Accession XM\_168425) is another VGAM437 host target gene. LOC222166 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222166, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222166 BINDING SITE, designated SEQ ID:45155, to the nucleotide sequence of VGAM437 RNA, herein designated VGAM RNA, also designated SEQ ID:3148.

[20694] Another function of VGAM437 is therefore inhibition of LOC222166 (Accession XM\_168425). Accordingly, utilities of VGAM437 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222166. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 438 (VGAM438) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20695] VGAM438 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM438 was detected is described hereinabove with reference to Figs. 1–8.

[20696] VGAM438 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tomato Bushy Stunt Virus. VGAM438 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20697] VGAM438 gene encodes a VGAM438 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM438 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM438 precursor RNA is designated SEQ ID:424, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:424 is located at position 3276 relative to the genome of Tomato Bushy Stunt Virus.

[20698] VGAM438 precursor RNA folds onto itself, forming VGAM438 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20699] An enzyme complex designated DICER COMPLEX, `dices` the VGAM438 folded precursor RNA into VGAM438 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM438 RNA is designated SEQ ID:3149, and is provided hereinbelow with reference to the sequence listing part.

[20700] VGAM438 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM438 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM438 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[20701] VGAM438 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM438 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM438 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM438 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM438 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[20702] The complementary binding of VGAM438 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM438 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM438 host target RNA into VGAM438 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20703] It is appreciated that VGAM438 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM438 host target genes. The mRNA of each one of this plurality of VGAM438 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM438 RNA, herein designated VGAM RNA, and which when bound by VGAM438 RNA causes inhibition of translation of respective one or more VGAM438 host target proteins.

[20704] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM438 gene, herein designated VGAM GENE, on one or more VGAM438 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[20705] It is yet further appreciated that a function of VGAM438 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM438 include diagnosis, prevention and treatment of viral infection by Tomato Bushy Stunt Virus. Specific functions, and accordingly utilities, of VGAM438 correlate with, and may be deduced from, the identity of the host target genes which VGAM438 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20706] Nucleotide sequences of the VGAM438 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM438 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM438 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM438 are further described hereinbelow with reference to Table 1.

[20707] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM438 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM438 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20708] As mentioned hereinabove with reference to Fig. 1, a function of VGAM438 gene, herein designated VGAM is inhibition of expression of VGAM438 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM438 correlate with, and may be deduced from, the identity of the target genes which VGAM438 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20709] Alcohol Dehydrogenase 5 (class III), Chi Polypeptide (ADH5, Accession NM\_000671) is a VGAM438 host target gene. ADH5 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by ADH5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADH5 BINDING SITE, designated SEQ ID:6323, to the nucleotide sequence of VGAM438 RNA, herein designated VGAM RNA, also designated SEQ ID:3149.

[20710] A function of VGAM438 is therefore inhibition of Alcohol Dehydrogenase 5 (class III), Chi Polypeptide (ADH5, Accession NM\_000671), a gene which oxidizes ethanol and activated by fatty acids. It oxidizes ethanol very poorly. Accordingly, utilities of VGAM438 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADH5. The function of ADH5 has been established by previous studies. See 103720. Adinolfi et al. (1984) purified the chi isozyme of ADH (EC 1.1.1.1) from human liver and used it to raise immune sera. Its immunologic properties suggested that it has no structural similarity to either class I (ADH1, ADH2, ADH3) or class II (ADH4) isozymes. The chi isozyme was found in most human tissues including fetal specimens of 16 weeks gestational age and showed a preference for long chain primary alcohols with a double bond in the beta position. Adinolfi

et al. (1984) concluded that the locus, designated ADH5, has a separate evolutionary origin from other ADH genes. (The class I ADH isozymes are virtually indistinguishable immunologically; the genes that determine them presumably originated by gene duplication.) Class III or chi ADH has specificity for complex alcohols of high molecular weight such as cinnamyl alcohol. Beisswenger et al. (1985) showed that ADH-chi is the only ADH isozyme in brain. It oxidizes ethanol very poorly; its function in brain is unknown. Since its gene is expressed constitutively in somatic cell hybrids, Carlock et al. (1985) could assign the locus to chromosome 4, specifically 4q21-q25, by analysis of gene products in starch gel electrophoresis. Smith (1986) gave the regional assignment as 4q21-q24. Goldman et al. (1989) isolated and sequenced a full-length cDNA for the class III alcohol dehydrogenase ADH5. By analysis of human/hamster hybrid cell lines, ADH5 was mapped to chromosome 4 where other ADH genes have been located, including class I genes and a class II gene, all of which metabolize ethanol, and the unusual class III ADH, which does not. Analysis of mouse/hamster hybrid cell lines showed that the corresponding gene maps to mouse chromosome 3, which carries the other murine

ADH genes. The sequence of ADH5 indicated that it is about equidistant between class I and class II ADHs. In contrast to other ADHs whose expression is more restricted, class III ADH was found to be expressed ubiquitously in human and rodent tissues. Giri et al. (1989) also mapped the gene to mouse chromosome 3. Matsuo and Yokoyama (1990) demonstrated a processed pseudogene derived from the ADH5 gene. Engeland et al. (1993) reported the kinetic characterization of human class III ADH altered at position 115 to asp and to ala by in vitro mutagenesis. The results indicated that the arg115 residue is a component of the binding site for activating fatty acids and is critical for the binding of S-hydroxymethylglutathione in glutathione-dependent formaldehyde dehydrogenase activity.

[20711] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20712] Matsuo, Y.; Yokoyama, S. : Cloning and sequencing of a processed pseudogene derived from a human class III alcohol dehydrogenase gene. Am. J. Hum. Genet. 46: 85-91, 1990. ; and

[20713] Engeland, K.; Hoog, J.-O.; Holmquist, B.; Estonius, M.;

Jornvall, H.; Vallee, B. L. : Mutation of arg-115 of human class III alcohol dehydrogenase: a binding site required for formaldehy.

[20714] Further studies establishing the function and utilities of ADH5 are found in John Hopkins OMIM database record ID 103710, and in cited publications numbered 811-818 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Endoglin (Osler-Rendu-Weber syndrome 1) (ENG, Accession NM\_000118) is another VGAM438 host target gene. ENG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ENG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ENG BINDING SITE, designated SEQ ID:5590, to the nucleotide sequence of VGAM438 RNA, herein designated VGAM RNA, also designated SEQ ID:3149.

[20715] Another function of VGAM438 is therefore inhibition of Endoglin (Osler-Rendu-Weber syndrome 1) (ENG, Accession NM\_000118). Accordingly, utilities of VGAM438 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ENG. Protein Phos-

phatase 4, Regulatory Subunit 2 (PPP4R2, Accession NM\_019853) is another VGAM438 host target gene. PPP4R2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PPP4R2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP4R2 BINDING SITE, designated SEQ ID:21256, to the nucleotide sequence of VGAM438 RNA, herein designated VGAM RNA, also designated SEQ ID:3149.

[20716] Another function of VGAM438 is therefore inhibition of Protein Phosphatase 4, Regulatory Subunit 2 (PPP4R2, Accession NM\_019853). Accordingly, utilities of VGAM438 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP4R2.

LOC200854 (Accession XM\_113396) is another VGAM438 host target gene. LOC200854 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC200854, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200854 BINDING

SITE, designated SEQ ID:42252, to the nucleotide sequence of VGAM438 RNA, herein designated VGAM RNA, also designated SEQ ID:3149.

[20717] Another function of VGAM438 is therefore inhibition of LOC200854 (Accession XM\_113396). Accordingly, utilities of VGAM438 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200854. LOC253187 (Accession XM\_173139) is another VGAM438 host target gene. LOC253187 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253187, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253187 BINDING SITE, designated SEQ ID:46392, to the nucleotide sequence of VGAM438 RNA, herein designated VGAM RNA, also designated SEQ ID:3149.

[20718] Another function of VGAM438 is therefore inhibition of LOC253187 (Accession XM\_173139). Accordingly, utilities of VGAM438 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253187. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 439 (VGAM439) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20719] VGAM439 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM439 was detected is described hereinabove with reference to Figs. 1–8.

[20720] VGAM439 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Tomato Bushy Stunt Virus. VGAM439 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20721] VGAM439 gene encodes a VGAM439 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM439 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM439 precursor RNA is designated SEQ ID:425, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:425 is located at position 2898 relative to the genome of Tomato

## Bushy Stunt Virus.

[20722] VGAM439 precursor RNA folds onto itself, forming VGAM439 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20723] An enzyme complex designated DICER COMPLEX, `dices` the VGAM439 folded precursor RNA into VGAM439 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM439 RNA is designated SEQ ID:3150, and is provided hereinbelow with reference to the sequence listing part.

[20724] VGAM439 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM439 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM439 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[20725] VGAM439 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM439 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM439 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM439 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM439 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[20726] The complementary binding of VGAM439 RNA, herein designated VGAM RNA, to host target binding sites on VGAM439 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM439 host target RNA into VGAM439 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20727] It is appreciated that VGAM439 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM439 host target genes. The mRNA of each one of this plurality of VGAM439 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM439 RNA, herein designated VGAM RNA, and which when bound by VGAM439 RNA causes inhibition of translation of respective one or more VGAM439 host target proteins.

[20728] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM439 gene, herein designated VGAM GENE, on one or more VGAM439 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[20729] It is yet further appreciated that a function of VGAM439 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM439 include diagnosis, prevention and treatment of viral infection by Tomato Bushy Stunt Virus. Specific functions, and accordingly utilities, of VGAM439

correlate with, and may be deduced from, the identity of the host target genes which VGAM439 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20730] Nucleotide sequences of the VGAM439 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM439 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM439 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM439 are further described hereinbelow with reference to Table 1.

[20731] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM439 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM439 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20732] As mentioned hereinabove with reference to Fig. 1, a function of VGAM439 gene, herein designated VGAM is inhibition of expression of VGAM439 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM439 correlate with, and may be deduced

from, the identity of the target genes which VGAM439 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20733] GAC1 (Accession NM\_006338) is a VGAM439 host target gene. GAC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GAC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAC1 BINDING SITE, designated SEQ ID:13039, to the nucleotide sequence of VGAM439 RNA, herein designated VGAM RNA, also designated SEQ ID:3150.

[20734] A function of VGAM439 is therefore inhibition of GAC1 (Accession NM\_006338). Accordingly, utilities of VGAM439 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAC1. GRAF (Accession NM\_015071) is another VGAM439 host target gene. GRAF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRAF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRAF BINDING SITE, designated SEQ

ID:17446, to the nucleotide sequence of VGAM439 RNA, herein designated VGAM RNA, also designated SEQ ID:3150.

[20735] Another function of VGAM439 is therefore inhibition of GRAF (Accession NM\_015071), a gene which is a GTPase activating protein for p21-rac. Accordingly, utilities of VGAM439 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRAF. The function of GRAF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM430. Nuclear Factor I/B (NFIB, Accession NM\_005596) is another VGAM439 host target gene. NFIB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NFIB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFIB BINDING SITE, designated SEQ ID:12121, to the nucleotide sequence of VGAM439 RNA, herein designated VGAM RNA, also designated SEQ ID:3150.

[20736] Another function of VGAM439 is therefore inhibition of Nuclear Factor I/B (NFIB, Accession NM\_005596), a gene

which recognizes and binds the palindromic sequence 5'-ttggcnnnnngccaa-3' present in viral and cellular promoters. Accordingly, utilities of VGAM439 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFIB. The function of NFIB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM100.SMG1 (Accession NM\_015092) is another VGAM439 host target gene. SMG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SMG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMG1 BINDING SITE, designated SEQ ID:17478, to the nucleotide sequence of VGAM439 RNA, herein designated VGAM RNA, also designated SEQ ID:3150.

[20737] Another function of VGAM439 is therefore inhibition of SMG1 (Accession NM\_015092), a gene which acts as the target for the cell-cycle arrest and immunosuppressive effects. Accordingly, utilities of VGAM439 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMG1. The function of SMG1 and its

association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM419. Bromodomain Containing 4 (BRD4, Accession NM\_058243) is another VGAM439 host target gene. BRD4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BRD4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BRD4 BINDING SITE, designated SEQ ID:27775, to the nucleotide sequence of VGAM439 RNA, herein designated VGAM RNA, also designated SEQ ID:3150.

[20738] Another function of VGAM439 is therefore inhibition of Bromodomain Containing 4 (BRD4, Accession NM\_058243). Accordingly, utilities of VGAM439 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRD4. Aspartyl-tRNA Synthetase (DARS, Accession NM\_001349) is another VGAM439 host target gene. DARS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DARS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DARS BINDING SITE, designated SEQ ID:7030, to the nucleotide sequence of VGAM439 RNA, herein designated VGAM RNA, also designated SEQ ID:3150.

[20739] Another function of VGAM439 is therefore inhibition of Aspartyl-tRNA Synthetase (DARS, Accession NM\_001349). Accordingly, utilities of VGAM439 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DARS. FLJ14641 (Accession NM\_032817) is another VGAM439 host target gene. FLJ14641 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14641, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14641 BINDING SITE, designated SEQ ID:26590, to the nucleotide sequence of VGAM439 RNA, herein designated VGAM RNA, also designated SEQ ID:3150.

[20740] Another function of VGAM439 is therefore inhibition of FLJ14641 (Accession NM\_032817). Accordingly, utilities of VGAM439 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14641.

KIAA1056 (Accession NM\_014894) is another VGAM439 host target gene. KIAA1056 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1056, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1056 BINDING SITE, designated SEQ ID:17049, to the nucleotide sequence of VGAM439 RNA, herein designated VGAM RNA, also designated SEQ ID:3150.

[20741] Another function of VGAM439 is therefore inhibition of KIAA1056 (Accession NM\_014894). Accordingly, utilities of VGAM439 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1056. KIAA1854 (Accession XM\_049884) is another VGAM439 host target gene. KIAA1854 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1854, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1854 BINDING SITE, designated SEQ ID:35520, to the nucleotide sequence of VGAM439 RNA, herein designated

VGAM RNA, also designated SEQ ID:3150.

[20742] Another function of VGAM439 is therefore inhibition of KIAA1854 (Accession XM\_049884). Accordingly, utilities of VGAM439 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1854. MGC15631 (Accession NM\_032753) is another VGAM439 host target gene. MGC15631 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC15631, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15631 BINDING SITE, designated SEQ ID:26488, to the nucleotide sequence of VGAM439 RNA, herein designated VGAM RNA, also designated SEQ ID:3150.

[20743] Another function of VGAM439 is therefore inhibition of MGC15631 (Accession NM\_032753). Accordingly, utilities of VGAM439 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15631. SAM Domain and HD Domain 1 (SAMHD1, Accession XM\_028704) is another VGAM439 host target gene. SAMHD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

SAMHD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SAMHD1 BINDING SITE, designated SEQ ID:30736, to the nucleotide sequence of VGAM439 RNA, herein designated VGAM RNA, also designated SEQ ID:3150.

[20744] Another function of VGAM439 is therefore inhibition of SAM Domain and HD Domain 1 (SAMHD1, Accession XM\_028704). Accordingly, utilities of VGAM439 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SAMHD1. Williams–Beuren Syndrome Chromosome Region 23 (WBSCR23, Accession NM\_025042) is another VGAM439 host target gene. WBSCR23 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by WBSCR23, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WBSCR23 BINDING SITE, designated SEQ ID:24639, to the nucleotide sequence of VGAM439 RNA, herein designated VGAM RNA, also designated SEQ ID:3150.

[20745] Another function of VGAM439 is therefore inhibition of Williams–Beuren Syndrome Chromosome Region 23 (WBSCR23, Accession NM\_025042). Accordingly, utilities of VGAM439 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WB–SCR23. LOC162333 (Accession XM\_102591) is another VGAM439 host target gene. LOC162333 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC162333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162333 BINDING SITE, designated SEQ ID:42136, to the nucleotide sequence of VGAM439 RNA, herein designated VGAM RNA, also designated SEQ ID:3150.

[20746] Another function of VGAM439 is therefore inhibition of LOC162333 (Accession XM\_102591). Accordingly, utilities of VGAM439 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162333. LOC220003 (Accession XM\_166230) is another VGAM439 host target gene. LOC220003 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC220003, cor–

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220003 BINDING SITE, designated SEQ ID:44051, to the nucleotide sequence of VGAM439 RNA, herein designated VGAM RNA, also designated SEQ ID:3150.

[20747] Another function of VGAM439 is therefore inhibition of LOC220003 (Accession XM\_166230). Accordingly, utilities of VGAM439 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220003. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 440 (VGAM440) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20748] VGAM440 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM440 was detected is described hereinabove with reference to Figs. 1–8.

[20749] VGAM440 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM440 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20750] VGAM440 gene encodes a VGAM440 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM440 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM440 precursor RNA is designated SEQ ID:426, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:426 is located at position 22113 relative to the genome of Vaccinia Virus.

[20751] VGAM440 precursor RNA folds onto itself, forming VGAM440 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20752] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM440 folded precursor RNA into VGAM440 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM440 RNA is designated SEQ ID:3151, and is provided hereinbelow with reference to the sequence listing part.

[20753] VGAM440 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM440 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM440 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[20754] VGAM440 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM440 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM440 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM440 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM440 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[20755] The complementary binding of VGAM440 RNA, herein designated VGAM RNA, to host target binding sites on VGAM440 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM440 host target RNA into VGAM440 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20756] It is appreciated that VGAM440 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM440 host target genes. The mRNA of each one of this plurality of VGAM440 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM440 RNA, herein designated VGAM RNA, and which when bound by VGAM440 RNA causes inhibition of translation of respective one or more VGAM440 host target proteins.

[20757] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM440 gene, herein designated VGAM GENE, on one or more VGAM440 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[20758] It is yet further appreciated that a function of VGAM440 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM440 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM440 correlate with, and may be deduced from, the identity of the host target genes which VGAM440 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20759] Nucleotide sequences of the VGAM440 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM440 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM440 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM440 are further described hereinbelow with reference to Table 1.

[20760] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM440 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM440 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20761] As mentioned hereinabove with reference to Fig. 1, a function of VGAM440 gene, herein designated VGAM is inhibition of expression of VGAM440 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM440 correlate with, and may be deduced from, the identity of the target genes which VGAM440 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20762] Autocrine Motility Factor Receptor (AMFR, Accession NM\_138958) is a VGAM440 host target gene. AMFR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AMFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AMFR BINDING SITE, designated SEQ ID:29066, to the nu-

cleotide sequence of VGAM440 RNA, herein designated VGAM RNA, also designated SEQ ID:3151.

[20763] A function of VGAM440 is therefore inhibition of Autocrine Motility Factor Receptor (AMFR, Accession NM\_138958), a gene which acts to stimulate migration of fibrosarcoma cells. Accordingly, utilities of VGAM440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AMFR. The function of AMFR has been established by previous studies. Autocrine motility factor (AMF; 172400) is a protein secreted by tumor cells that stimulates tumor motility. Its receptor is a 78-kD glycoprotein (gp78). Watanabe et al. (1991) cloned the AMFR cDNA. The gene encodes a 323-amino acid polypeptide that has a single transmembrane domain and several putative glycosylation sites. The protein sequence has some homology to human tumor protein p53 (OMIM Ref. No. 191170). Hirono et al. (1996) used immunohistochemistry to examine the expression of AMFR in gastric cancer specimens. The level of expression was associated with the pathologic stage and grade of tumor penetration. Positive AMFR expression was significantly associated with poor prognosis.

[20764] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [20765] Hirono, Y.; Fushida, S.; Yonemura, Y.; Yamamoto, H.; Watanabe, H.; Raz, A. : Expression of autocrine motility factor receptor correlates with disease progression in human gastric cancer. Brit. J. Cancer 74: 2003–2007, 1996. ; and
- [20766] Watanabe, H.; Carmi, P.; Hogan, V.; Raz, T.; Silletti, S.; Nabi, I. R.; Raz, A. : Purification of human tumor cell autocrine motility factor and molecular cloning of its receptor. J. Bio.
- [20767] Further studies establishing the function and utilities of AMFR are found in John Hopkins OMIM database record ID 603243, and in cited publications numbered 1079–1082 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromogranin A (parathyroid secretory protein 1) (CHGA, Accession NM\_001275) is another VGAM440 host target gene. CHGA BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CHGA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

CHGA BINDING SITE, designated SEQ ID:6939, to the nucleotide sequence of VGAM440 RNA, herein designated VGAM RNA, also designated SEQ ID:3151.

[20768] Another function of VGAM440 is therefore inhibition of Chromogranin A (parathyroid secretory protein 1) (CHGA, Accession NM\_001275), a gene which regulates dense-core secretory granule biogenesis and hormone sequestration. Accordingly, utilities of VGAM440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHGA. The function of CHGA has been established by previous studies. Kim et al. (2001) presented evidence that regulation of dense-core secretory granule biogenesis and hormone secretion in endocrine cells is dependent on CGA. Downregulation of CGA expression in a neuroendocrine cell line, PC12, by antisense RNAs led to profound loss of dense-core secretory granules, impairment of regulated secretion of a transfected prohormone, and reduction of secretory granule proteins. Transfection of bovine Cga into a CGA-deficient PC12 clone rescued the regulated secretory phenotype. Stable transfection of CGA into a CGA-deficient pituitary cell line, 6T3, which lacks a regulated secretory pathway, restored regulated secretion. Overexpression of

CGA induced dense-core granules, immunoreactive for CGA, in nonendocrine fibroblast CV-1 cells. Kim et al. (2001) concluded that CGA is an 'on/off' switch that alone is sufficient to drive dense-core secretory granule biogenesis and hormone sequestration in endocrine cells.

Granberg et al. (1999) measured CgA in 36 patients with type I multiple endocrine neoplasia (MEN1; 131100), of whom 9 lacked pancreatic involvement, 20 had biochemical evidence of pancreatic endocrine tumors, and 7 displayed radiologically detectable pancreatic tumors. CgA was also analyzed in 25 patients with sporadic pancreatic endocrine tumors, 39 subjects with inflammatory bowel disease, 7 patients harboring nonendocrine pancreatic disease, and 19 healthy controls. Of the MEN1 patients without pancreatic involvement, 4 of 9 (44%) had elevated CgA. Furthermore, 60% with biochemically unequivocal tumors and all with a radiologically visible tumor showed elevations. All 25 patients with sporadic pancreatic endocrine tumors had increased CgA, as did 28% of patients with inflammatory bowel disease and 57% with nonendocrine pancreatic disease. Granberg et al. (1999) concluded that nonendocrine diseases can cause elevations of CgA, and its spontaneous variation can be considerable.

While plasma CgA is the most sensitive of the basal markers for neuroendocrine tumors, the authors felt that it could not replace other established measures when screening for early pancreatic involvement in MEN1.

[20769] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20770] Granberg, D.; Stridsberg, M.; Seensalu, R.; Eriksson, B.; Lundqvist, G.; Oberg, K.; Skogseid, B. : Plasma chromogranin A in patients with multiple endocrine neoplasia type 1. J. Clin. Endocr. Metab. 84: 2712–2717, 1999. ; and

[20771] Kim, T.; Tao-Cheng, J.-H.; Eiden, L. E.; Loh, Y. P. : Chromogranin A, an 'on/off' switch controlling dense-core secretory granule biogenesis. Cell 106: 499–509, 2001.

[20772] Further studies establishing the function and utilities of CHGA are found in John Hopkins OMIM database record ID 118910, and in cited publications numbered 12299–1230 and 790–259 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ10842 (Accession NM\_018238) is another VGAM440 host target gene. FLJ10842 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10842, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10842 BINDING SITE, designated SEQ ID:20187, to the nucleotide sequence of VGAM440 RNA, herein designated VGAM RNA, also designated SEQ ID:3151.

[20773] Another function of VGAM440 is therefore inhibition of FLJ10842 (Accession NM\_018238). Accordingly, utilities of VGAM440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10842. FLJ22969 (Accession XM\_044006) is another VGAM440 host target gene. FLJ22969 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22969, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22969 BINDING SITE, designated SEQ ID:34067, to the nucleotide sequence of VGAM440 RNA, herein designated VGAM RNA, also designated SEQ ID:3151.

[20774] Another function of VGAM440 is therefore inhibition of FLJ22969 (Accession XM\_044006). Accordingly, utilities of VGAM440 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ22969. FLJ23510 (Accession NM\_024720) is another VGAM440 host target gene. FLJ23510 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ23510, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23510 BINDING SITE, designated SEQ ID:24052, to the nucleotide sequence of VGAM440 RNA, herein designated VGAM RNA, also designated SEQ ID:3151.

[20775] Another function of VGAM440 is therefore inhibition of FLJ23510 (Accession NM\_024720). Accordingly, utilities of VGAM440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23510. FLJ23519 (Accession NM\_032240) is another VGAM440 host target gene. FLJ23519 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23519, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23519 BINDING SITE, designated SEQ ID:25971, to the nucleotide sequence of

VGAM440 RNA, herein designated VGAM RNA, also designated SEQ ID:3151.

[20776] Another function of VGAM440 is therefore inhibition of FLJ23519 (Accession NM\_032240). Accordingly, utilities of VGAM440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23519. KIAA0961 (Accession NM\_014898) is another VGAM440 host target gene. KIAA0961 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0961, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0961 BINDING SITE, designated SEQ ID:17071, to the nucleotide sequence of VGAM440 RNA, herein designated VGAM RNA, also designated SEQ ID:3151.

[20777] Another function of VGAM440 is therefore inhibition of KIAA0961 (Accession NM\_014898). Accordingly, utilities of VGAM440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0961. KIAA1265 (Accession XM\_047707) is another VGAM440 host target gene. KIAA1265 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1265, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1265 BINDING SITE, designated SEQ ID:35034, to the nucleotide sequence of VGAM440 RNA, herein designated VGAM RNA, also designated SEQ ID:3151.

[20778] Another function of VGAM440 is therefore inhibition of KIAA1265 (Accession XM\_047707). Accordingly, utilities of VGAM440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1265. Solute Carrier Family 6 (neurotransmitter transporter), Member 14 (SLC6A14, Accession NM\_007231) is another VGAM440 host target gene. SLC6A14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC6A14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC6A14 BINDING SITE, designated SEQ ID:14100, to the nucleotide sequence of VGAM440 RNA, herein designated VGAM RNA, also designated SEQ ID:3151.

[20779] Another function of VGAM440 is therefore inhibition of Solute Carrier Family 6 (neurotransmitter transporter), Member 14 (SLC6A14, Accession NM\_007231). Accordingly, utilities of VGAM440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC6A14. Tumor Protein P53 Inducible Nuclear Protein 1 (TP53INP1, Accession XM\_053740) is another VGAM440 host target gene. TP53INP1 BINDING SITE1 and TP53INP1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TP53INP1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TP53INP1 BINDING SITE1 and TP53INP1 BINDING SITE2, designated SEQ ID:36114 and SEQ ID:27103 respectively, to the nucleotide sequence of VGAM440 RNA, herein designated VGAM RNA, also designated SEQ ID:3151.

[20780] Another function of VGAM440 is therefore inhibition of Tumor Protein P53 Inducible Nuclear Protein 1 (TP53INP1, Accession XM\_053740). Accordingly, utilities of VGAM440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TP53INP1.

LOC147429 (Accession XM\_085793) is another VGAM440 host target gene. LOC147429 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147429, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147429 BINDING SITE, designated SEQ ID:38335, to the nucleotide sequence of VGAM440 RNA, herein designated VGAM RNA, also designated SEQ ID:3151.

[20781] Another function of VGAM440 is therefore inhibition of LOC147429 (Accession XM\_085793). Accordingly, utilities of VGAM440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147429. LOC154007 (Accession XM\_087824) is another VGAM440 host target gene. LOC154007 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154007, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154007 BINDING SITE, designated SEQ ID:39455, to the nucleotide sequence of VGAM440 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:3151.

[20782] Another function of VGAM440 is therefore inhibition of LOC154007 (Accession XM\_087824). Accordingly, utilities of VGAM440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154007. LOC196337 (Accession XM\_113696) is another VGAM440 host target gene. LOC196337 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196337 BINDING SITE, designated SEQ ID:42358, to the nucleotide sequence of VGAM440 RNA, herein designated VGAM RNA, also designated SEQ ID:3151.

[20783] Another function of VGAM440 is therefore inhibition of LOC196337 (Accession XM\_113696). Accordingly, utilities of VGAM440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196337. LOC200197 (Accession XM\_114148) is another VGAM440 host target gene. LOC200197 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200197, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200197 BINDING SITE, designated SEQ ID:42730, to the nucleotide sequence of VGAM440 RNA, herein designated VGAM RNA, also designated SEQ ID:3151.

[20784] Another function of VGAM440 is therefore inhibition of LOC200197 (Accession XM\_114148). Accordingly, utilities of VGAM440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200197. LOC200681 (Accession XM\_117260) is another VGAM440 host target gene. LOC200681 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200681, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200681 BINDING SITE, designated SEQ ID:43341, to the nucleotide sequence of VGAM440 RNA, herein designated VGAM RNA, also designated SEQ ID:3151.

[20785] Another function of VGAM440 is therefore inhibition of LOC200681 (Accession XM\_117260). Accordingly, utilities of VGAM440 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC200681. LOC221583 (Accession XM\_166396) is another VGAM440 host target gene. LOC221583 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221583, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221583 BINDING SITE, designated SEQ ID:44245, to the nucleotide sequence of VGAM440 RNA, herein designated VGAM RNA, also designated SEQ ID:3151.

[20786] Another function of VGAM440 is therefore inhibition of LOC221583 (Accession XM\_166396). Accordingly, utilities of VGAM440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221583. LOC51301 (Accession NM\_016591) is another VGAM440 host target gene. LOC51301 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51301 BINDING SITE, designated SEQ ID:18670, to the

nucleotide sequence of VGAM440 RNA, herein designated VGAM RNA, also designated SEQ ID:3151.

[20787] Another function of VGAM440 is therefore inhibition of LOC51301 (Accession NM\_016591). Accordingly, utilities of VGAM440 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51301. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 441 (VGAM441) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20788] VGAM441 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM441 was detected is described hereinabove with reference to Figs. 1–8.

[20789] VGAM441 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM441 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20790] VGAM441 gene encodes a VGAM441 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM441 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM441 precursor RNA is designated SEQ ID:427, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:427 is located at position 78448 relative to the genome of Vaccinia Virus.

[20791] VGAM441 precursor RNA folds onto itself, forming VGAM441 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20792] An enzyme complex designated DICER COMPLEX, `dices` the VGAM441 folded precursor RNA into VGAM441 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of VGAM441 RNA is designated SEQ ID:3152, and is provided hereinbelow with reference to the sequence listing part.

[20793] VGAM441 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM441 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM441 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[20794] VGAM441 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM441 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM441 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM441 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM441 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[20795] The complementary binding of VGAM441 RNA, herein designated VGAM RNA, to host target binding sites on VGAM441 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM441 host target RNA into VGAM441 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20796] It is appreciated that VGAM441 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM441 host target genes. The mRNA of each one of this plurality of VGAM441 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM441 RNA, herein designated VGAM RNA, and which when bound by VGAM441 RNA causes inhibition of translation of respective one or more VGAM441 host target proteins.

[20797] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM441 gene, herein designated VGAM GENE, on one or more VGAM441 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science  
294,779 (2001)).

[20798] It is yet further appreciated that a function of VGAM441 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM441 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM441 correlate with, and may be deduced from, the identity of the host target genes which VGAM441 binds and inhibits, and the function of these host target genes, as elaborated herein–below.

[20799] Nucleotide sequences of the VGAM441 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM441 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM441 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM441 are further described hereinbelow with reference to Table 1.

[20800] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM441 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM441 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20801] As mentioned hereinabove with reference to Fig. 1, a function of VGAM441 gene, herein designated VGAM is inhibition of expression of VGAM441 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM441 correlate with, and may be deduced from, the identity of the target genes which VGAM441 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20802] Cyclin T2 (CCNT2, Accession NM\_058241) is a VGAM441 host target gene. CCNT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CCNT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCNT2 BINDING SITE, designated SEQ ID:27770, to the nucleotide sequence of VGAM441 RNA, herein designated VGAM RNA, also designated SEQ ID:3152.

[20803] A function of VGAM441 is therefore inhibition of Cyclin T2 (CCNT2, Accession NM\_058241), a gene which is a regu-

latory subunit of the cyclin-dependent kinase pair (cdk9/cyclin t) complex. Accordingly, utilities of VGAM441 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCNT2. The function of CCNT2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM159. Endothelin Receptor Type A (EDNRA, Accession XM\_034331) is another VGAM441 host target gene. EDNRA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EDNRA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EDNRA BINDING SITE, designated SEQ ID:32056, to the nucleotide sequence of VGAM441 RNA, herein designated VGAM RNA, also designated SEQ ID:3152.

[20804] Another function of VGAM441 is therefore inhibition of Endothelin Receptor Type A (EDNRA, Accession XM\_034331), a gene which binds endothelins, and induces intracellular calcium flux and arachidonic acid accumulation. Accordingly, utilities of VGAM441 include di-

agnosis, prevention and treatment of diseases and clinical conditions associated with EDNRA. The function of EDNRA has been established by previous studies. See 131244.

The endothelin receptor with highest affinity for ET1 (OMIM Ref. No. 131240) has been called ETA. Cyr et al. (1991) isolated a cDNA clone of a human endothelin receptor from a placental cDNA library. The deduced amino acid sequence was 94% identical to the bovine endothelin ETA receptor and was judged to represent the human homolog. They assigned the ETRA gene to chromosome 4 by analysis of its segregation pattern in rodent/human hybrids. Hosoda et al. (1992) isolated and characterized the gene for the human endothelin-A receptor. Southern blot analyses demonstrated that it is present in single copy. The gene spans more than 40 kb and contains 8 exons and 7 introns. The transcription start site, determined by primer extension experiments, was 502 bp upstream of the methionine initiation codon. Using human/rodent somatic hybrid cell DNAs, Hosoda et al. (1992) also assigned the gene to chromosome 4. Northern blot analyses demonstrated a 4.3-kb mRNA in a wide variety of human tissues with the highest level in the aorta and a substantial level in cultured human mesangial cells. Endothelin-1

inhibits active Na–K transport by as much as 50% in the renal tubule and other tissues (Zeidel et al., 1989). Okafor and Delamere (2001) noted that the presence of low levels of ET1 in aqueous humor combined with the potential for release of ET1 from ciliary processes suggested that the crystalline lens could be exposed to ET1 in vivo. They studied the influence of ET1 on active Na–K transport in the porcine lens. Their results suggested that ET1 inhibited active lens Na–K transport by activating EDNRA and EDNRB. Activation of the ET receptors also caused an increase in cytoplasmic calcium concentration in cultured lens epithelial cells. Both responses to ET1 appear to have a tyrosine kinase step.

[20805] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20806] Hosoda, K.; Nakao, K.; Tamura, N.; Arai, H.; Ogawa, Y.; Suga, S.; Nakanishi, S.; Imura, H. : Organization, structure, chromosomal assignment, and expression of the gene encoding the human endothelin–A receptor. *J. Biol. Chem.* 267: 18797–18804, 1992. ; and

[20807] Okafor, M. C.; Delamere, N. A. : The inhibitory influence of endothelin on active sodium–potassium transport in

porcine lens. Invest. Ophthal. Vis. Sci. 42: 1018–1023, 2001.

[20808] Further studies establishing the function and utilities of EDNRA are found in John Hopkins OMIM database record ID 131243, and in cited publications numbered 12215–4038, 2278, 228 and 4039 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Growth Factor Receptor–bound Protein 10 (GRB10, Accession NM\_005311) is another VGAM441 host target gene. GRB10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GRB10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRB10 BINDING SITE, designated SEQ ID:11785, to the nucleotide sequence of VGAM441 RNA, herein designated VGAM RNA, also designated SEQ ID:3152.

[20809] Another function of VGAM441 is therefore inhibition of Growth Factor Receptor–bound Protein 10 (GRB10, Accession NM\_005311), a gene which plays a functional role in insulin and IGF–I signaling. Accordingly, utilities of VGAM441 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with GRB10. The function of GRB10 has been established by previous studies. Src homology region 2 (SH2) domain proteins bind to autophosphorylated growth factor receptors after activation of the receptors by ligand. By screening an NIH 3T3 library with the epidermal growth factor receptor (EGFR; 131550) by use of the CORT technique (Skolnik et al., 1991), Ooi et al. (1995) cloned and characterized mouse Grb10. Grb10 undergoes serine but not tyrosine phosphorylation after EGF treatment and binds poorly to the EGFR, suggesting that another protein binds the EGFR in vivo. Ooi et al. (1995) mapped the mouse Grb10 gene to chromosome 11. By using the yeast 2-hybrid system to identify proteins that interact with the cytoplasmic tyrosine kinase domain of the insulin receptor (INSR; 147670), Liu and Roth (1995) isolated a GRB10 cDNA from HeLa cells. The cDNA, called GRB-IR by them, encodes a predicted 548-amino acid protein containing an SH2 domain and an incomplete pleckstrin-homology (PH) domain. RT-PCR showed that the GRB10 gene is alternatively spliced, producing transcripts that encode proteins either with or without a 46-amino acid stretch that contains part of the PH domain. The SH2 and PH domains of the human GRB10

protein are 99% and 84% identical, respectively, to those of mouse Grb10. Northern blot analysis showed that the GRB10 gene is expressed as 2.2-, 5.0-, and 6.5-kb transcripts, predominantly in skeletal muscle and pancreas. Western blot analysis of HeLa cell lysates detected 50-, 65-, and 68-kD proteins. GRB10 binds with high affinity to autophosphorylated INSR in vitro. After treatment of cells with insulin (INS; 176730), GRB10 forms complexes with INSR. The formation of this complex inhibits the insulin-induced increase in phosphorylation of IRS1 (OMIM Ref. No. 147545) and a 60-kD GTPase-activating protein (GAP)-associated protein, suggesting that GRB10 inhibits or redirects the INSR signaling pathway.

[20810] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20811] Liu, F.; Roth, R. A. : Grb-IR: a SH2-domain-containing protein that binds to the insulin receptor and inhibits its function. Proc. Nat. Acad. Sci. 92: 10287-10291, 1995. ; and

[20812] Ooi, J.; Yajnik, V.; Immanuel, D.; Gordon, M.; Moskow, J. J.; Buchberg, A. M.; Margolis, B. : The cloning of Grb10 reveals a new family of SH2 domain proteins. Oncogene 10:

1621–1630, 1.

[20813] Further studies establishing the function and utilities of GRB10 are found in John Hopkins OMIM database record ID 601523, and in cited publications numbered 6526, 6527–6528, 1809, 6529–6530, 1810–181 and 6531 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. 5–hydroxytryptamine (serotonin) Receptor 4 (HTR4, Accession NM\_000870) is another VGAM441 host target gene. HTR4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HTR4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTR4 BINDING SITE, designated SEQ ID:6540, to the nucleotide sequence of VGAM441 RNA, herein designated VGAM RNA, also designated SEQ ID:3152.

[20814] Another function of VGAM441 is therefore inhibition of 5–hydroxytryptamine (serotonin) Receptor 4 (HTR4, Accession NM\_000870), a gene which mediates calcium channel currents. Accordingly, utilities of VGAM441 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTR4. The function of

HTR4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM65. Jagged 1 (Alagille syndrome) (JAG1, Accession NM\_000214) is another VGAM441 host target gene. JAG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JAG1 BINDING SITE, designated SEQ ID:5712, to the nucleotide sequence of VGAM441 RNA, herein designated VGAM RNA, also designated SEQ ID:3152.

[20815] Another function of VGAM441 is therefore inhibition of Jagged 1 (Alagille syndrome) (JAG1, Accession NM\_000214). Accordingly, utilities of VGAM441 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JAG1. DKFZP434P1750 (Accession NM\_015527) is another VGAM441 host target gene. DKFZP434P1750 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434P1750, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434P1750 BINDING SITE, designated SEQ ID:17793, to the nucleotide sequence of VGAM441 RNA, herein designated VGAM RNA, also designated SEQ ID:3152.

[20816] Another function of VGAM441 is therefore inhibition of DKFZP434P1750 (Accession NM\_015527). Accordingly, utilities of VGAM441 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434P1750. NCUBE1 (Accession NM\_016021) is another VGAM441 host target gene. NCUBE1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NCUBE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCUBE1 BINDING SITE, designated SEQ ID:18094, to the nucleotide sequence of VGAM441 RNA, herein designated VGAM RNA, also designated SEQ ID:3152.

[20817] Another function of VGAM441 is therefore inhibition of NCUBE1 (Accession NM\_016021). Accordingly, utilities of VGAM441 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCUBE1.

NS1-BP (Accession XM\_051877) is another VGAM441 host target gene. NS1-BP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NS1-BP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NS1-BP BINDING SITE, designated SEQ ID:35914, to the nucleotide sequence of VGAM441 RNA, herein designated VGAM RNA, also designated SEQ ID:3152.

[20818] Another function of VGAM441 is therefore inhibition of NS1-BP (Accession XM\_051877). Accordingly, utilities of VGAM441 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NS1-BP. LOC132720 (Accession XM\_059597) is another VGAM441 host target gene. LOC132720 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC132720, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC132720 BINDING SITE, designated SEQ ID:37028, to the nucleotide sequence of VGAM441 RNA, herein designated VGAM RNA,

also designated SEQ ID:3152.

[20819] Another function of VGAM441 is therefore inhibition of LOC132720 (Accession XM\_059597). Accordingly, utilities of VGAM441 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132720. LOC146957 (Accession XM\_085652) is another VGAM441 host target gene. LOC146957 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146957, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146957 BINDING SITE, designated SEQ ID:38283, to the nucleotide sequence of VGAM441 RNA, herein designated VGAM RNA, also designated SEQ ID:3152.

[20820] Another function of VGAM441 is therefore inhibition of LOC146957 (Accession XM\_085652). Accordingly, utilities of VGAM441 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146957. LOC158014 (Accession XM\_088442) is another VGAM441 host target gene. LOC158014 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158014, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158014 BINDING SITE, designated SEQ ID:39688, to the nucleotide sequence of VGAM441 RNA, herein designated VGAM RNA, also designated SEQ ID:3152.

[20821] Another function of VGAM441 is therefore inhibition of LOC158014 (Accession XM\_088442). Accordingly, utilities of VGAM441 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158014. LOC51339 (Accession NM\_016651) is another VGAM441 host target gene. LOC51339 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51339, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51339 BINDING SITE, designated SEQ ID:18770, to the nucleotide sequence of VGAM441 RNA, herein designated VGAM RNA, also designated SEQ ID:3152.

[20822] Another function of VGAM441 is therefore inhibition of LOC51339 (Accession NM\_016651). Accordingly, utilities of VGAM441 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC51339. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 442 (VGAM442) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20823] VGAM442 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM442 was detected is described hereinabove with reference to Figs. 1–8.

[20824] VGAM442 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM442 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20825] VGAM442 gene encodes a VGAM442 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM442 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM442 precursor RNA is designated SEQ

ID:428, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:428 is located at position 78761 relative to the genome of Vaccinia Virus.

[20826] VGAM442 precursor RNA folds onto itself, forming VGAM442 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20827] An enzyme complex designated DICER COMPLEX, `dices` the VGAM442 folded precursor RNA into VGAM442 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM442 RNA is designated SEQ ID:3153, and is provided hereinbelow with reference to the sequence

listing part.

[20828] VGAM442 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM442 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM442 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[20829] VGAM442 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM442 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM442 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM442 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM442 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[20830] The complementary binding of VGAM442 RNA, herein designated VGAM RNA, to host target binding sites on VGAM442 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM442 host target RNA into VGAM442 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20831] It is appreciated that VGAM442 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM442 host target genes. The mRNA of each one of this plurality of VGAM442 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM442 RNA, herein designated VGAM

RNA, and which when bound by VGAM442 RNA causes inhibition of translation of respective one or more VGAM442 host target proteins.

[20832] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM442 gene, herein designated VGAM GENE, on one or more VGAM442 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[20833] It is yet further appreciated that a function of VGAM442 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM442 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM442 correlate with, and may be deduced from, the identity of the host target genes which VGAM442 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[20834] Nucleotide sequences of the VGAM442 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM442 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM442 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM442 are further described hereinbelow with reference to Table 1.

[20835] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM442 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM442 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[20836] As mentioned hereinabove with reference to Fig. 1, a function of VGAM442 gene, herein designated VGAM is

inhibition of expression of VGAM442 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM442 correlate with, and may be deduced from, the identity of the target genes which VGAM442 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20837] Kallmann Syndrome 1 Sequence (KAL1, Accession NM\_000216) is a VGAM442 host target gene. KAL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KAL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KAL1 BINDING SITE, designated SEQ ID:5719, to the nucleotide sequence of VGAM442 RNA, herein designated VGAM RNA, also designated SEQ ID:3153.

[20838] A function of VGAM442 is therefore inhibition of Kallmann Syndrome 1 Sequence (KAL1, Accession NM\_000216). Accordingly, utilities of VGAM442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KAL1. Synaptotagmin IV (SYT4, Accession XM\_031162) is another VGAM442 host target gene. SYT4 BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by SYT4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYT4 BINDING SITE, designated SEQ ID:31292, to the nucleotide sequence of VGAM442 RNA, herein designated VGAM RNA, also designated SEQ ID:3153.

[20839] Another function of VGAM442 is therefore inhibition of Synaptotagmin IV (SYT4, Accession XM\_031162), a gene which may be involved in  $Ca^{2+}$ -dependent exocytosis of secretory vesicles or may serve as  $Ca^{2+}$  sensors in the process of vesicular trafficking and exocytosis. Accordingly, utilities of VGAM442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYT4. The function of SYT4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM200.KIAA0895 (Accession XM\_166573) is another VGAM442 host target gene. KIAA0895 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0895, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0895 BINDING SITE, designated SEQ ID:44544, to the nucleotide sequence of VGAM442 RNA, herein designated VGAM RNA, also designated SEQ ID:3153.

[20840] Another function of VGAM442 is therefore inhibition of KIAA0895 (Accession XM\_166573). Accordingly, utilities of VGAM442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0895. LOC161589 (Accession XM\_090991) is another VGAM442 host target gene. LOC161589 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC161589, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC161589 BINDING SITE, designated SEQ ID:40024, to the nucleotide sequence of VGAM442 RNA, herein designated VGAM RNA, also designated SEQ ID:3153.

[20841] Another function of VGAM442 is therefore inhibition of LOC161589 (Accession XM\_090991). Accordingly, utilities of VGAM442 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC161589. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 443 (VGAM443) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20842] VGAM443 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM443 was detected is described hereinabove with reference to Figs. 1–8.

[20843] VGAM443 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM443 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[20844] VGAM443 gene encodes a VGAM443 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM443 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM443 precursor RNA is designated SEQ ID:429, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:429 is located at position 81960 relative to the genome of Vaccinia Virus.

[20845] VGAM443 precursor RNA folds onto itself, forming VGAM443 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20846] An enzyme complex designated DICER COMPLEX, `dices` the VGAM443 folded precursor RNA into VGAM443 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM443 RNA is designated SEQ ID:3154, and is provided hereinbelow with reference to the sequence listing part.

[20847] VGAM443 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM443 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM443 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[20848] VGAM443 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM443 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM443 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM443 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM443 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[20849] The complementary binding of VGAM443 RNA, herein designated VGAM RNA, to host target binding sites on VGAM443 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM443 host target RNA into VGAM443 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[20850] It is appreciated that VGAM443 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM443 host target genes. The mRNA of each one of this plurality of VGAM443 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM443 RNA, herein designated VGAM RNA, and which when bound by VGAM443 RNA causes in-

hibition of translation of respective one or more VGAM443 host target proteins.

[20851] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM443 gene, herein designated VGAM GENE, on one or more VGAM443 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[20852] It is yet further appreciated that a function of VGAM443 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM443 include diagnosis, prevention and

treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM443 correlate with, and may be deduced from, the identity of the host target genes which VGAM443 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [20853] Nucleotide sequences of the VGAM443 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM443 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM443 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM443 are further described hereinbelow with reference to Table 1.
- [20854] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM443 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM443 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [20855] As mentioned hereinabove with reference to Fig. 1, a function of VGAM443 gene, herein designated VGAM is inhibition of expression of VGAM443 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM443 correlate with, and may be deduced from, the identity of the target genes which VGAM443 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[20856] 2',3'-cyclic Nucleotide 3' Phosphodiesterase (CNP, Accession NM\_033133) is a VGAM443 host target gene. CNP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNP BINDING SITE, designated SEQ ID:26976, to the nucleotide sequence of VGAM443 RNA, herein designated VGAM RNA, also designated SEQ ID:3154.

[20857] A function of VGAM443 is therefore inhibition of 2',3'-cyclic Nucleotide 3' Phosphodiesterase (CNP, Accession NM\_033133), a gene which can link tubulin to membranes and may regulate cytoplasmic microtubule distribution. Accordingly, utilities of VGAM443 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNP. The function of CNP has been established by previous studies. Cyclic nucleotide phos-

phodiesterase is a useful marker of myelin. CNPase is a membrane-bound enzyme found at high concentrations in central nervous system myelin and in the outer segments of photoreceptors in the retina (Vogel and Thompson, 1988). Two proteins with CNP activity are known to exist in brain and lymphoid tissues. They appear to be the products of distinct but related mRNA species. Kurihara et al. (1990) showed that the 2 gene products can arise by translation of 2 mRNAs alternatively spliced from a single transcript. In bovine and human brain, there appears to be a single species of mRNA (Vogel and Thompson, 1988), and the bovine brain and retinal forms of the enzyme appear to be identical in sequence Bifulco et al. (2002) demonstrated that CNP is firmly associated with tubulin (OMIM Ref. No. 602529) from brain tissue and thyroid cells. They showed that CNP acts as a microtubule-associated protein in promoting microtubule assembly. This activity was found to reside in the C terminus of the enzyme. The authors concluded that CNP is a membrane-bound microtubule-associated protein that can link tubulin to membranes and may regulate cytoplasmic microtubule distribution

[20858] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[20859] Vogel, U. S.; Thompson, R. J. : Molecular structure, localization, and possible functions of the myelin-associated enzyme 2-prime,3-prime-cyclic nucleotide 3-prime-phosphodiesterase. J. Neurochem. 50: 1667-1677, 1988. ; and

[20860] Bifulco, M.; Laezza, C.; Stingo, S.; Wolff, J. : 2-prime,3-prime-cyclic nucleotide 3-prime-phosphodiesterase: a membrane-bound, microtubule-associated protein and membrane anchor for tub.

[20861] Further studies establishing the function and utilities of CNP are found in John Hopkins OMIM database record ID 123830, and in cited publications numbered 4336-4337, 4334-4335, 4330-433 and 4338-4340 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Nuclear Receptor Coactivator 4 (NCOA4, Accession NM\_005437) is another VGAM443 host target gene. NCOA4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NCOA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of NCOA4 BINDING SITE, designated SEQ ID:11922, to the nucleotide sequence of VGAM443 RNA, herein designated VGAM RNA, also designated SEQ ID:3154.

[20862] Another function of VGAM443 is therefore inhibition of Nuclear Receptor Coactivator 4 (NCOA4, Accession NM\_005437), a gene which Binds and activates androgen receptor (AR) in ligand-dependent manner. Accordingly, utilities of VGAM443 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCOA4. The function of NCOA4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM420. Transcription Factor Binding to IGHM Enhancer 3 (TFE3, Accession NM\_006521) is another VGAM443 host target gene. TFE3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TFE3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TFE3 BINDING SITE, designated SEQ ID:13274, to the nucleotide sequence of VGAM443 RNA, herein designated VGAM RNA,

also designated SEQ ID:3154.

[20863] Another function of VGAM443 is therefore inhibition of Transcription Factor Binding to IGHM Enhancer 3 (TFE3, Accession NM\_006521), a gene which is a positive-acting transcription factor that binds to the immunoglobulin enhancer  $\mu$ E3 motif. Accordingly, utilities of VGAM443 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TFE3. The function of TFE3 has been established by previous studies. TFE3, a member of the helix-loop-helix family of transcription factors, binds to the  $\mu$ -E3 motif of the immunoglobulin heavy-chain enhancer and is expressed in many cell types. Henthorn et al. (1991) localized the TFE3 gene to the proximal short arm of the X chromosome using a somatic cell hybrid panel. A frequent RsaI RFLP detected by the TFE3 cDNA was found and used to confirm this location by linkage analysis, which placed TFE3 near markers in Xp11.22. In the course of high-resolution comparative mapping of the proximal region of the mouse X chromosome, Blair et al. (1995) mapped the Tfe3 gene to the same region as the Gata1 gene (OMIM Ref. No. 305371). Heimann et al. (2001) identified the ASPSCR1 gene, which they called RCC17, partnered with TFE3 in two 5-year-old

Belgian girls of African origin in whom papillary renal cell carcinomas carried the translocation t(X;17)(p11.2;q25). In both patients, the t(X;17) fused the N terminal region of RCC17 to the C terminal region of TFE3 including the bHLH DNA-binding domain and the leucine zipper dimerization domain. The reciprocal fusion transcript TFE3/RCC17 was also expressed.

[20864] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[20865] Heimann, P.; El Housni, H.; Ogur, G.; Weterman, M. A. J.; Petty, E. M.; Vassart, G. : Fusion of a novel gene, RCC17, to the TFE3 gene in t(X;17)(p11.2;q25.3)-bearing papillary renal cell carcinomas. Cancer Res. 61: 4130-4135, 2001. ; and

[20866] Blair, H. J.; Ho, M.; Monaco, A. P.; Fisher, S.; Craig, I. W.; Boyd, Y. : High-resolution comparative mapping of the proximal region of the mouse X chromosome. Genomics 28: 305-310, 199.

[20867] Further studies establishing the function and utilities of TFE3 are found in John Hopkins OMIM database record ID 314310, and in cited publications numbered 6569, 8207-8212, 1553, 8213-821 and 10617 listed in the bib-

liography section hereinbelow, which are also hereby incorporated by reference. Vacuolar Protein Sorting 26 (yeast) (VPS26, Accession NM\_004896) is another VGAM443 host target gene. VPS26 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VPS26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VPS26 BINDING SITE, designated SEQ ID:11329, to the nucleotide sequence of VGAM443 RNA, herein designated VGAM RNA, also designated SEQ ID:3154.

[20868] Another function of VGAM443 is therefore inhibition of Vacuolar Protein Sorting 26 (yeast) (VPS26, Accession NM\_004896), a gene which is a sorting protein—ensures the proper delivery of organelle-specific proteins. Accordingly, utilities of VGAM443 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VPS26. The function of VPS26 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM315. Caspase Recruitment Domain Family, Member 6 (CARD6, Accession

NM\_032587) is another VGAM443 host target gene. CARD6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CARD6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CARD6 BINDING SITE, designated SEQ ID:26322, to the nucleotide sequence of VGAM443 RNA, herein designated VGAM RNA, also designated SEQ ID:3154.

[20869] Another function of VGAM443 is therefore inhibition of Caspase Recruitment Domain Family, Member 6 (CARD6, Accession NM\_032587). Accordingly, utilities of VGAM443 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CARD6. DKFZp761K1423 (Accession NM\_018422) is another VGAM443 host target gene. DKFZp761K1423 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DKFZp761K1423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761K1423 BINDING SITE, designated

SEQ ID:20475, to the nucleotide sequence of VGAM443 RNA, herein designated VGAM RNA, also designated SEQ ID:3154.

[20870] Another function of VGAM443 is therefore inhibition of DKFZp761K1423 (Accession NM\_018422). Accordingly, utilities of VGAM443 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761K1423. KIAA0090 (Accession XM\_114045) is another VGAM443 host target gene. KIAA0090 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0090, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0090 BINDING SITE, designated SEQ ID:42655, to the nucleotide sequence of VGAM443 RNA, herein designated VGAM RNA, also designated SEQ ID:3154.

[20871] Another function of VGAM443 is therefore inhibition of KIAA0090 (Accession XM\_114045). Accordingly, utilities of VGAM443 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0090. KIAA0543 (Accession XM\_044213) is another VGAM443 host target gene. KIAA0543 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0543, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0543 BINDING SITE, designated SEQ ID:34180, to the nucleotide sequence of VGAM443 RNA, herein designated VGAM RNA, also designated SEQ ID:3154.

[20872] Another function of VGAM443 is therefore inhibition of KIAA0543 (Accession XM\_044213). Accordingly, utilities of VGAM443 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0543. Lymphocyte Antigen 75 (LY75, Accession NM\_002349) is another VGAM443 host target gene. LY75 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LY75, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LY75 BINDING SITE, designated SEQ ID:8152, to the nucleotide sequence of VGAM443 RNA, herein designated VGAM RNA, also designated SEQ ID:3154.

[20873] Another function of VGAM443 is therefore inhibition of

Lymphocyte Antigen 75 (LY75, Accession NM\_002349). Accordingly, utilities of VGAM443 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LY75. LOC146179 (Accession XM\_085354) is another VGAM443 host target gene. LOC146179 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146179, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146179 BINDING SITE, designated SEQ ID:38077, to the nucleotide sequence of VGAM443 RNA, herein designated VGAM RNA, also designated SEQ ID:3154.

[20874] Another function of VGAM443 is therefore inhibition of LOC146179 (Accession XM\_085354). Accordingly, utilities of VGAM443 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146179. LOC221399 (Accession XM\_168134) is another VGAM443 host target gene. LOC221399 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221399, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC221399 BINDING SITE, designated SEQ ID:45053, to the nucleotide sequence of VGAM443 RNA, herein designated VGAM RNA, also designated SEQ ID:3154.

[20875] Another function of VGAM443 is therefore inhibition of LOC221399 (Accession XM\_168134). Accordingly, utilities of VGAM443 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221399. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 444 (VGAM444) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[20876] VGAM444 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM444 was detected is described hereinabove with reference to Figs. 1–8.

[20877] VGAM444 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM444 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[20878] VGAM444 gene encodes a VGAM444 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM444 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM444 precursor RNA is designated SEQ ID:430, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:430 is located at position 81204 relative to the genome of Vaccinia Virus.

[20879] VGAM444 precursor RNA folds onto itself, forming VGAM444 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[20880] An enzyme complex designated DICER COMPLEX, `dices` the VGAM444 folded precursor RNA into VGAM444 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 51%) nucleotide sequence of VGAM444 RNA is designated SEQ ID:3155, and is provided hereinbelow with reference to the sequence listing part.

[20881] VGAM444 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM444 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM444 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.
